MARINE CORPS ORDER 8420.13

From: Commandant of the Marine Corps

To: Distribution List

Subj: MATERIEL FIELDING PLAN (MFP) FOR THE M1A1 TANK

Ref: (a) MCO P4105.3

Encl: (1) Materiel Fielding Plan for the M1A1 Tank

1. Purpose. The enclosure is published in accordance with the provisions of reference (a). It is intended to serve as the single, stand-alone document which consolidates all actions, schedules, procedures, requirements, and information necessary to ship, deprocess, deploy, and sustain the M1A1.

2. Information. The MFP provides information in sufficient detail, accuracy, and timeliness to allow field commanders of the receiving and supporting units to plan and budget for the arrival and support of the M1A1. The M1A1 may be placed in service upon attainment of the criteria set forth in reference (a).

3. M1A1 Accelerated Fielding. On 17 September 1990, the Commandant of the Marine Corps approved the accelerated fielding of the M1A1 Main Battle Tank (to meet requirements in Southwest Asia. Accelerated fielding will be executed using M1A1 tanks and associated equipment provided on a temporary loan basis by the U.S. Army. Accelerated fielding will not be addressed in this MFP, except in relation to its impact on the Marine Corps M1A1 Common Tank program. In those cases where the impact has not been determined (e.g., force structure, fielding schedules, retrograde schedules, etc.), the pertinent paragraphs and appendices will be notated as "to be provided separately".

4. Action. The procedures contained in this Order will be adhered to for fielding and placing the M1A1 tank in service. The primary responsibilities and implementing activities are defined under each major section.

MCO 8420.13
20 Aug 91

5. Reserve Applicability. This Order is applicable to the Marine Corps Reserve.

R.A.T.

MATERIEL FIELDING PLAN FOR THE M1A1 TANK

1. Introduction

a. Source of the Requirement. The Marine Corps requirement for the M1A1 tank is documented by Department of the Army (DA) Approved Revised Materiel Need (Engineering Development) (MN (ED)) for an MBT, CDOG Para 336a(13), ACN 20337 (U) as initially approved by CMC letter RDD-26, 22 September 1975, Subj: MBT Required Operational Capability (ROC), and revised in CMC letter RDD260601np, 3 December 1987, Subj: MBT ROC. The CMC letter stated that the MN(ED) meets USMC requirements with the additional requirement that the tank have a vehicle navigational assistance device and a Deep Water Fording Kit (DWFK). The Marine Corps requires the M1A1 to be capable of operation in an amphibious environment to include provisions for transportation aboard U.S. Navy amphibious ships. The Marine Corps plans to procure and deploy the M1A1 tank system to selected active Fleet Marine Force (FMF) and reserve component tank units as a replacement for the M60A1 Reliability Improved Selected Equipment (RISE)/Passive (R/P) Tank. The M1A1 tank will be procured with current production line configuration modifications as agreed to in annual reviews.

b. Points of Contact. The Assistant Program Manager (APM), Tank Systems Branch, Ground Weapons (CBGT), Marine Corps Research, Development, and Acquisition Command (MCRDAC), will serve as the focal point for all logistics assistance during initial fielding and assist in the resolution of problems which are neither addressed in this Materiel Fielding Plan (MFP) nor solvable through the efforts of normal logistical channels.

<u>Grade</u>	<u>Name</u>	<u>Position</u>	<u>Command</u>	<u>Code</u>	<u>Phone</u>

c. Fielding Methodology

(1) General Fielding Plan. The M1A1 will be fielded "vertically" in view of industrial, budgetary, training, and various other resource constraints. The submission of requisitions for the M1A1 is not required. Annex I to appendix A reflects the allowances and projected deliveries for the M1A1.

ENCLOSURE (1)

MCO 8420.13
20 Aug 91

During the M1A1 phase-in, the Marine Corps will be required to maintain a diminishing M60A1 R/P capability until M1A1 fielding is complete.

(2) Method of Fielding. The M1A1 and its support packages will be force-fed to gaining commands utilizing the U.S. Army's Total Package Fielding (TPF) concept. The TPF process provides for and coordinates the concurrent fielding of the M1A1 system and required support, to include initial spares/repair parts, starter set of publications, special tools and test equipment, and ancillary equipment. Tanks will be deprocessed by a Materiel Fielding Team (MFT) Deprocessing Team comprised of personnel from Anniston Army Depot (ANAD) augmented by Marine Corps personnel. In concert with M1A1 fielding, all M60A1 R/P assets will be declared excess and retrograded to the Primary Inventory Control Activity (PICA) for disposal.

(a) Active. A Marine Corps New Equipment Training Team (NETT) will conduct New Equipment Training (NET) in company-sized evolutions. Tank companies will cycle through MCAGCC for 29 training days of M1A1 NET. Active assets will be shipped to sites of gaining commands in accordance with a prescribed production schedule, deprocessed, and subsequently placed in service.

(b) Reserve. Designated M1A1 reserve tank companies will also undergo NET at MCAGCC.

d. Replaced Systems/Equipment

(1) <u>Items Replaced</u>	<u>TAMCN</u>	<u>NSN</u>
Tank, M60A1 R/P	E1875	2350-01-059-1503
Tank, M60A1 R/P w/Applique Armor	E1875	2350-01-225-7484
Tank, M60A1 R/P w/M9 Bulldozer Kit	E1876	2350-01-052-7373
Tank, M60A1 R/P w/M9 Bulldozer Kit w/Applique Armor	E1876	2350-01-273-9395

(2) Retrograde. Annex II of appendix A reflects the projected retrograde schedule for the M60A1 R/P. Once the M1A1 is placed in service, disposition instructions for the M60A1 R/P will be requested by gaining commands from the Commanding General (CG), MCLB (Code 833), Albany, GA. Separate instructions will be promulgated for tank units scheduled to redesignate and deactivate. The M60A1 R/P will be retrograded with all component items listed in SL-3-07585 except those listed below. Of the items listed below, only excesses generated by conversion from the M60A1 R/P to the M1A1 will be retrograded.

ENCLOSURE (1)

2. System Description

a. Administrative Information

- (1) Nomenclature: Tank, Combat, FT, 120 mm
Gun, M1A1
- (2) TAMCN: E1888 VII MP
- (3) Stores Account Code: 3
- (4) NSN: 2350-01-087-1095
- (5) Unit of Issue: ea

ENCLOSURE (1)

- (6) Hardware Unit Cost: \$2,112,000 (FY 89 HWE Cost)
- (7) Support Costs: Table 1
- (8) Equipment Density: Normal
- (9) Identification Number: 08953A

(10) Readiness Reporting: The M1A1, a combat essential item of equipment, is readiness reportable in accordance with MCO P3000.11, "Marine Corps Automated Readiness Evaluation System (MARES) Introduction/Policy Manual," and MCO P3000.13, "Marine Corps Status of Resources and Training System (SORTS) Standing Operating Procedures."

(a) MARES. Commanders will begin reporting on the M1A1 upon achieving Initial Operational Capability (IOC). Specific instructions will be published in Marine Corps Bulletins of the 3000 series. Commanders of active M60A1 R/P units will continue to report until directed otherwise. Footnote comments, if appropriate, will accompany reports.

(b) SORTS. When a battalion enters into M1A1 NET, it will be temporarily unavailable for operational commitments and its status will be reflected in SORTS as follows:

1 Report Category Level "C-5."

2 Reason organization not "C-1": "N" (resource allocation by CMC does not permit higher C-level).

3 Current status and activity code: "CV" (organization major equipment conversion).

4 Report measured resource levels (P, S, R, and T) with a "C-5" until all four respective areas have reached "C-3" level.

5 Ensure appropriate "RM3" resource area remarks are submitted, to include forecast. An "RM3" with the label "TREAD" is required; indicating the actual measured resource levels for P, S, R, T.

6 When all four measured resource area levels reach "C-3":

a Report unit status and activity code in the operational category "OP" (organization performing normal operational mission). (The "CV" to "OP" status transition can only be accomplished once per battalion for this transition.)

ENCLOSURE (1)

b Commence reporting overall level and measured resource area levels "C-1" through "C-4," as applicable.

Table 1.--Support Costs.

1. Annual support cost estimates for an M1A1 represent the sum of fuel, repair parts, and component repair costs. The current estimate of \$77,346 (FY 90 constant dollars) per tank per year is based on empirical data and assumes 850 mean miles usage.

2. Predict M1A1 annual support costs using the following formulas until such time as they may be supplanted by actual expense data:

$$C_T(\$/\text{yr}) = C_F(\$/\text{yr}) + C_{RP}(\$/\text{yr}) + C_{CR}(\$/\text{yr})$$

where

$C_T(\$/\text{yr})$ = Total Cost (Dollars/Year)

$C_F(\$/\text{yr})$ = Fuel Cost (Dollars/Year)

$C_{RP}(\$/\text{yr})$ = Repair Parts Cost (Dollars/Year)

$C_{CR}(\$/\text{yr})$ = Component Repair Cost (Dollars/Year)

$$C_F(\$/\text{yr}) = [\bar{c}_G(\$/\text{g})] * [\bar{f}_{C(g/\text{tk}/\text{m})}] * [F_{POL}] * [\bar{d}_{(m/\text{tk}/\text{yr})}] * [N] * [F_1]$$

$$C_{RP}(\$/\text{yr}) = [\bar{p}_{(\$/\text{tk}/\text{m})}] * [\bar{d}_{(m/\text{tk}/\text{yr})}] * [N] * [F_1]$$

$$C_{CR}(\$/\text{yr}) = [\bar{m}_{CR}(\$/\text{tk}/\text{m}) + \bar{l}_{CR}(\$/\text{tk}/\text{m})] * [\bar{d}_{(m/\text{tk}/\text{yr})}] * [N] * [F_1]$$

where

$\bar{c}_G(\$/\text{g})$ = Mean Cost per Gallon (Dollars/Gallon)

$\bar{f}_{C(g/\text{tk}/\text{m})}$ = Mean Fuel Consumption (Gallons/Tank/Mile)

F_{POL} = Factor (Other POL)

$\bar{d}_{(m/\text{tk}/\text{yr})}$ = Mean Distance (Miles/Tank/Year)

N = Number of Tanks

F_1 = Factor (Inflation)

$\bar{p}_{(\$/\text{tk}/\text{m})}$ = Mean Repair Parts Cost (Dollars/Tank/Mile)

MCO 8420.13

20 Aug 91

$\bar{m}_{CR}(\$/tk/m)$ = Mean Material Cost (Dollars/Tank/Mile)

$\bar{l}_{CR}(\$/tk/m)$ = Mean Labor Cost (Dollars/Tank/Mile)

3. Estimated annual support costs in FY90 constant dollars were derived as follows:

$$C_T(\$ / yr) = C_F(\$ / yr) + C_{RP}(\$ / yr) + C_{CR}(\$ / yr)$$

$$C_F(\$ / yr) = [\bar{c}_G(\$ / g)] * [\bar{f}_{C(g/tk/m)}] * [F_{POL}] * [\bar{d}_{(m/tk/yr)}] * [N] * [F_1]$$

$$C_F(\$ / yr) = [\$0.65/g] * [5.93g/m] * [1.13] * [850m/tk/yr] * [1tk] * [1]$$

$$C_F(\$ / yr) = \$3,702.25$$

$$C_{RP}(\$ / yr) = [\bar{p}_{(\$ / tk/m)}] * [\bar{d}_{(m/tk/yr)}] * [N] * [F_1]$$

$$C_{RP}(\$ / yr) = [\$58.81/tk/m] * [850m/tk/yr] * [1tk] * [1]$$

$$C_{RP}(\$ / yr) = \$49,988.50$$

$$C_{CR}(\$ / yr) = [\bar{m}_{CR}(\$/tk/m) + \bar{l}_{CR}(\$/tk/m)] * [\bar{d}_{(m/tk/yr)}] * [N] * [F_1]$$

$$C_{CR}(\$ / yr) = [\$18.90/tk/yr + \$8.93/tk/yr] * [850m/tk/yr] * [1tk] * [1]$$

$$C_{CR}(\$ / yr) = \$23,655.50$$

$$C_T(\$ / yr) = \$3,702.25 + \$49,988.50 + \$23,655.50 = \$77,346.25$$

4. The FY90 amounts derived from the Baseline Cost Estimate provided by U.S. Army Tank-Automotive Command are as follows:

Mean Cost per Gallon (Dollars/Gallon)	\$ 0.65
Mean Fuel Consumption (Gallons/Tank/Mile)	5.93
Other POL Factor	1.13
Mean Repair Parts Cost (Dollars/Tank/Mile)	\$58.81
Mean Material Cost (Dollars/Tank/Mile)	\$18.90
Mean Labor Cost (Dollars/Tank/Mile)	\$ 8.93

b. Physical Characteristics (See figures 1 through 7)

(1) Dimensions

Length (Gun Forward)	386.94 in
Length (Gun Forward w/DWFK)	404 in
Length (Gun Rearward)	355.64 in
Length (Hull)	312 in
Width	144 in
Width (Less Skirts)	137 in

ENCLOSURE (1)

6

8) 30.1 - 886

20 Aug 91

Width (w/Mine Clearing Blade (Closed))	154 in
Width (w/Mine Clearing Blade (Open))	182 in
Height	113.65 in
Height (w/DWFK)	140 in
Square	386.94 fty
Cube	3664.64 ft(3)
Ground Clearance: Hull Center	18.5 in
Other	16.5 in
Vehicle Center of Gravity	
(x) Longitudinal (forward of final drive centerline)	126.31 in
(y) Lateral (positive, right on centerline)	1.20 in
(z) Vertical (above ground line)	52.14 in
Vehicle Frontal Area	75.9 fty
Vehicle Side Area	162 fty
Vehicle Top Area	311 fty

(2) Weight

Weight (Combat Load)(1)	67.50 tons
Weight (Nominal)(2)	63.11 tons
Weight (Amphib Embark/Transport)	64.59 tons
Weight (MPS Embark/Transport)	63.56 tons
Weight (Turret)	22.32 tons
Ground Pressure (Average)	14.95 psi

Note 1: Combat load weight is the maximum vehicle weight of a fully fueled, production-configuration tank loaded with ammunition, component equipment, crew, and supplies. It is the maximum weight of a tank.

Note 2: Nominal weight is fully fueled, but without ammunition, component equipment, crew, and supplies. This approximates the weight of a tank in the tank park or maintenance bay.

(3) Armament

Main Weapon	120 mm, M256
Coaxial Machinegun	7.62 mm, M240
Commander's Machinegun	.50 cal, M2

20oF (-6oC) to 115oF (45oC)	DF-2 OR JP8
-10oF (-23oC) to 20oF (-6o)	Blend half and half NATO F-54 and F-34, or F-35, F-44, F-58, or ASTM D1655 Grade Jet-A-1. If blending isn't possible, use NATO F-34 or F-35, F-44, F-58, or ASTM D1655 Grade Jet-A-1.
Between -10oF (-23oC) and -25oF (-32oC)	NATO F-34 or F-35, F-44 or ASTM D1655 Grade Jet-A-1
Below -25oF (-32oC)	ASTM D1655 Grade Jet-A-1
Oil Capacity (including oil cooler and lines)	6.25 gals

(10) Transmission

Type (hydrokinetic-fully automatic)	X1100-3B
Torque Converter (TC-897)	3 Element
Transmission Ranges	4 Forward 2 Reverse
Steering (integral steer/throttle T-Bar control)	Hydrostatic
Turning Radius	Pivot to Infinity Variable
Braking (two fully independent systems)	Hydraulic and Mechanical
Oil Capacity (including oil coolers and lines)	45 gallons

(11) Final Drive

Type	Coaxial Planetary Gear Drive
Gear Reduction Ratio (final drive input to sprocket drive output)	4.67 to 1

(12) Turret

Main Gun/Coaxial Weapon	
Elevation limit-forward (100o right and left of tank centerline)	-9.5o to +20o
Elevation limit-rearward (70o right and left of tank centerline)	0o to +20o
Traverse capability (in either direction)	360o

ENCLOSURE (1)

Elevation tracking rate (powered)	0.25 mils/sec to 25 mils/sec
Elevation tracking rate (manual)	10 mils/crank rev
Traverse tracking rate (powered)	0.25 mils/sec to 75 mils/sec
Traverse tracking rate (manual)	5 or 10 mils/crank rev
Elevation maximum slew rate (control handles)	400 mils/sec
Elevation maximum slew rate (control handles and stabilization commands)	750 mils/sec
Traverse tracking rate (silent watch control)	up to 75 mils/sec
Elevation tracking rate (silent watch control)	up to 25 mils/sec
Slew rates for 1500 mil duration silent watch control)	up to 300 mils/sec

(13) Commander's Weapon

Elevation limit	-10o to +65o
Traverse capability (in either direction)	360o
Traverse tracking rate (powered)	Variable up to 400 mils/sec
Traverse tracking rate (manual)	Variable up to 178 mils/sec
Elevation tracking rate (manual)	Variable up to 110 mils/sec

(14) Loader's Weapon

Elevation limits	-35o to +65o
Firepower coverage (loader's sector of responsibility to left of turret)	265o

(15) Nuclear, Biological, and Chemical (NBC)

Minimum Crew Compartment Pressurization (hatches closed):	Normal	3.7 inches H(2)O
Gun Firing		0.0 inches H(2)O
Controllable Temperature		
High		80 oF
Low		65 oF
Minimum Ventilated-Face-Piece Air Supply		3 std ft(3)/min (each)
Minimum Air Cooled Vest Air Supply		14 std ft(3)/min (each)

ENCLOSURE (1)

(16) Auxiliary Automotive

Batteries	Military Type 6TN (lead acid)
Quantity	6
Connection	Series-Parallel
Capacity	300 ampere hours
Voltage	24 V dc

(17) Fire Detection/Suppression System

Type	Dual optical IR
Operation	Automatic
Suppressant	Halon 1301
Number of Sensors	7
Response Time	2 millisec maximum

(18) Power Requirements None

c. Operational Characteristics. The M1A1 tank is a full-tracked, highly mobile, direct fire, armored combat vehicle capable of sustained offensive and defensive combat in a Nuclear, Biological, and Chemical (NBC) environment. Operated by a crew of four, the tank is designed to close with and destroy enemy forces, fortifications, and materiel using armor protection, firepower, mobility, and shock action in both amphibious assaults and subsequent operations ashore. The M1A1 tank will satisfy the Marine Corps tank requirement during the near and midterm.

(1) Power Train. The M1A1 power pack consists of a 1500-horsepower turbine engine (AGT-1500), a hydrokinetic automatic transmission (X1100-3B), two final drives, the air cleaner system, the scavenging blower, and the cooling system. The powerpack and accessories are designed for ease of maintenance and have "quick disconnects" to facilitate removal. The AGT-1500 is a multifuel engine and will burn virtually any distillate for internal combustion engines. Transmission output is through identical left and right final drives to the track drive hub and sprocket assemblies. The governed engine speed allows a vehicle top speed of 41.5 mph on level, hard-surface roads. The power pack weighs approximately 8500 pounds and is 119-inches long, 80-inches wide, and 47-inches high.

(2) Suspension. The suspension system, with seven road wheels per side, is torsion bar-sprung and hydraulically dampened to provide tank mobility over cross-country terrain at speeds up to 30 mph.

20 Aug 91

(3) Main Armament. The 120 mm, M256 smoothbore gun, mounted in a traversable turret, is used against moving or stationary armored vehicles, fortifications, and enemy troops. Capable of destroying any weapon system on the modern battlefield, it is used primarily to destroy enemy armored vehicles, but can also be used to destroy fortified material-type target and enemy troops.

(4) Secondary Armament. The secondary weapons consist of two 7.62 mm, M240 machineguns and a .50 caliber, M2 machinegun. One 7.62 mm, M240 machinegun is coaxially mounted on the right side of the main gun mount and is intended for use against soft targets. The other 7.62 mm, M240 machinegun is skate-mounted at the loader's station and is used against soft targets and aircraft. The .50 caliber, M2 machinegun mounted at the Commander's Weapon Station (CWS) is used against soft targets, lightly armored vehicles and aircraft. Additionally, the M257 smoke grenade launchers (eight tubes per side) provide the tank with a means of evading the enemy and/or defending against antitank, optically guided missiles. When both sets of grenade launchers are fired, they produce a 120o smoke screen 30 meters in front of the tank. The launchers, which are mounted externally on the turret, are aimed by rotating the turret. Each launcher holds four 40 mm grenades, which are electrically fired. One reload complement is stowed outside the turret.

(5) NBC Defense. NBC protection is provide primarily through an overpressure protection system (filtered air for breathing and crew compartment pressurization). Individual protection (ventilated face piece and protective overgarment) is also provided as a backup should the primary system fail. Cooled air to the crew compartment and to each crewman's ventilated face piece and air-cooled vest provide protection against heat stress. The NBC system uses bleed air from the engine, which is passed through an air cycle system where it is cooled by a heat exchanger and expansion turbine. The cooled air then proceeds through the NBC composite filters where contaminants are removed. Finally, the cooled air is circulated to each crewman's ventilated face piece and air-cooled vest as well as the crew compartment. In the event of a malfunction of the main NBC system, the backup NBC system will supply the crew compartment with filtered air. An AN/VDR-2 radiac meter is located in the crew compartment to detect low threshold gamma radiation. Decontamination capability is provided by three ABC-M11 DS-2 decontamination devices (one stowed in the crew compartment and one in each turret cargo stowage box).

(6) Fire Control. The fire control system integrates a 120 mm smoothbore cannon with a laser range finder, full solution solid-state digital computer, environmental sensors, stabilized

ENCLOSURE (1)

gun, and stabilized day/thermal sights to optimize first round hit probability. The tank's stabilization system permits accurate firing-on-the-move capability at cross-country speeds up to 30 mph. The gunner merely places his reticle on the target, lases, and fires. The laser determines the range, and the computer determines and applies the weapon sight offset angles necessary to obtain a target hit when the gunner squeezes the trigger. The M1A1 MBT Fire Control System will be calibrated (boresight and zero) in accordance with U.S. Marine Corps Technical Manual TM 08953A-10/1-3.

(7) Ergonomics. Human factors have been optimized in the design of crew stations. Simple controls are grouped so that crew operations are performed at maximum efficiency.

(8) Armor Protection. Weld-fabricated, rolled, homogeneous armor, combined in the hull and turret armor assemblies, provides frontal armor protection. The turret front and sides, including the gun shield, are protected against the specified large caliber threats. Large caliber protection for the hull front is provided by high obliquity upper and lower glacis armor assemblies across the entire hull width. Hull and turret side protection consists of armor assemblies and armored skirting. The rear hull and turret armor assemblies and rear grille doors protect the tank's rear turret and power pack compartments.

(9) Survivability. Crew and tank survivability are enhanced by compartmentalized stowage of fuel and ammunition, by minimizing visual and noise signatures, and by nuclear hardening electronic components. Compartmentalized stowage of fuel and ammunition reduces the likelihood of secondary fires or explosions which may destroy the tank or injure the crew. Minimizing visual and noise signatures reduces the probability of being detected for attack by mortars, rockets, or missiles. Nuclear hardening ensures that the tank's electronic subsystems will remain operable after a nuclear explosion which will generate various effects, including: shock, thermal, Electromagnetic Pulse (EMP), and transient radiation.

(10) Operational Data

Gross Horsepower-to-Weight Ratio (combat loaded tank)	22.4 hp/ton
Maximum Forward Governed Speed (hard, level surface)	41.5 mph
Sustained Speed (60 percent grade) NBC on 4.0 mph NBC off 4.1 mph	
Cross-Country Speed	up to 30 mph
Acceleration (forward direction, 0 to 20 mph, dry and level paved roads)	NBC on 7.1 sec NBC off 6.8 sec

3. Logistic Support

a. Maintenance Support

(1) General. The maintenance concept for the M1A1 tank is in consonance with Marine Corps maintenance policy as defined by MCO 4856.1, "Marine Corps Maintenance Policy," and as amplified by the forthcoming M1A1 Maintenance Plan. The Marine Corps will mirror and parallel U.S. Army maintenance efforts on the M1A1. The M1A1 tank will be supported under MCO P4790.2, "Marine Corps Integrated Maintenance Management System (MIMMS)

ENCLOSURE (1)

20 Aug 91

Field Procedures Manual, "which contains policy and procedures for the maintenance management of ground equipment. The key to successful M1A1 maintenance is the scrupulous performance of scheduled checks and services. Systemic features of M1A1 maintenance are:

(a) Subsystem configurations incorporate relatively inexpensive consumable parts, standardization, and modularity to simplify maintenance and enhance efficiency.

(b) The M1A1 embodies numerous line replaceable units (LRU's) designed for rapid fault isolation and replacement.

(c) Use of test equipment is fundamental to the maintenance effort.

(d) Maintenance is accomplished at the lowest level, as far forward as possible.

(e) Authorization, level, and procedures for system preventive/corrective and scheduled/unscheduled maintenance activities are contained in applicable technical manuals (TM's).

(2) Categories/Echelons. Maintenance of the M1A1 will be conducted in accordance with the maintenance levels (organizational through depot) and corresponding echelons (first through fifth) contained in MCO P4790.1, "MIMMS Introduction Manual." Maintenance will be performed only within the echelon(s) authorized to perform the functions. Preventive maintenance will be conducted primarily as a first-echelon function (less semiannual servicing), and corrective maintenance will be accomplished at the lowest appropriate echelon. Replacement of failed or worn components will be accomplished at the appropriate echelon, depending upon the requirements for special tools, facilities, procedures, or particular skills necessary to accomplish the corrective action.

(3) Responsibilities. Tank company personnel are responsible for performing organizational (first and second echelon) maintenance. The tank battalion Headquarters and Service Company (H&S Co) is authorized to conduct organizational and intermediate maintenance (up to and including third echelon) on the tank and vehicular components, vehicle-mounted weapons, and vehicle-mounted VHF radio equipment. Force Service Support Groups (FSSG's) will perform intermediate (third echelon) maintenance beyond the tank battalions' capabilities (overflow) as well as general support (fourth echelon) maintenance. Depot-level (fifth echelon) maintenance will be accomplished through depot support (external to the Marine Corps) via Depot Maintenance Interservice Support Agreements (DMISA's) and contractor support. Lead service responsibility for depot

ENCLOSURE (1)

20 Aug 91

maintenance is the U.S. Army. Depots authorized to perform M1A1 maintenance are Anniston Army Depot and Mainz Army Depot.

(4) Levels of Maintenance

(a) Organizational Level. Maintenance in this category consists of functions performed in the first and second echelons. Approximately 90 percent of all malfunctions are detectable and correctable at the organizational level. Both Built-In Test Equipment (BITE) and portable field test sets are used to rapidly isolate malfunctions. Applicable functions and the performing agency at each echelon are:

1 First Echelon. Maintenance functions in this echelon are performed by the crews of individual tanks. Crew maintenance consists of Preventive Maintenance Checks and Services (PMCS) (daily, weekly, and monthly), lubrication, limited troubleshooting and repair, and monitoring/reporting system conditions. Authorized functions for this echelon are limited to preventive maintenance for:

a Vehicle and Vehicular Components. Inspection, lubrication, cleaning, preserving, tightening, and performing minor adjustments to mechanical, electrical, hydraulic, and pneumatic systems are crew functions. Examples are lamp replacements, resetting tripped circuit breakers, and securing loose electrical connectors. Daily checks are simplified by use of PMCS lists provided in the operator's manual. Hull service items such as engine transmission oil levels, filters, fuel pumps, and fuel control need attention only when indicated by the maintenance monitors on the Driver's Instrument Panel (DIP) or where warranted by PMCS. BITE information is displayed on the DIP, the computer control panel, and the Gunner's Primary Sight (GPS) panel. Any evidence of a system malfunction which the crew cannot clear is reported to company maintenance for fault isolation and correction.

b Main Gun and Other Vehicle-Mounted Weapons. Maintenance consists of inspecting, cleaning, lubricating, and adjusting.

c Vehicle-Mounted Radio Equipment. Maintenance consists of inspection and cleaning of exterior components and associated equipment.

d Fire Control System. Maintenance consists of cleaning optics and inspection of the Muzzle Reference Sensor (MRS) for missing and damaged hardware, scratches, moisture, or dirt in the sight. Cleaning is performed when necessary. The same procedure is followed for the other fire control system components.

ENCLOSURE (1)

2 Second Echelon. Maintenance personnel organic to the tank company (aided by the tank crew) will perform selected preventive and corrective maintenance functions within this maintenance echelon. Second-echelon maintenance can fault isolate to the LRU. Major assemblies or modular components which require repair beyond the capabilities of the tank company will be evacuated to battalion maintenance.

a Vehicle and Vehicular Components. Maintenance consists of diagnosis and fault isolation of malfunctions in major assemblies or modular components using instrumentation installed on the vehicle or test equipment authorized in the tank company Table of Equipment (T/E). Replacement of defective major assemblies or modular components is performed if such replacement can be accomplished with organic common tools and if the replacement item does not require critical adjustment or alignment in order to perform as intended. An organizational test set, the Simplified Test Equipment-M1 (STE-M1), which plugs into subsystems, is used to supplement BITE for fault isolation.

b Main Gun and Other Vehicle-Mounted Weapons. Maintenance consists of preventive maintenance, fault diagnosis, and piece part replacement (machinegun firing pins, for example).

c Vehicle-Mounted Radio Equipment. Maintenance consists of preventive maintenance, fault diagnosis, and replacement of easily accessible piece parts, such as knobs, indicator lamps, handsets, and headphones.

d Fire Control System. Maintenance consists of diagnosis and fault isolation of malfunctions in components using instrumentation installed in the tank, or test equipment authorized by the tank company T/E; replacement of defective parts and components is performed as necessary.

(b) Intermediate Level. Maintenance in this category consists of functions performed in the third and fourth echelons. Applicable functions and the performing agencies are as follows:

1 Third Echelon. the tank battalion (H&S Co) will perform the following third-echelon maintenance using organic maintenance personnel, repair parts, and secondary reparables from the Supported Activity Supply System (SASSY) Management Unit (SMU). LRU's are fault-isolated and repaired by module or component replacement.

a Vehicle and Vehicular Components. Maintenance consists of diagnosis/fault isolation, adjustment/alignment of modular components which can be accomplished with organic test equipment, replacement of

components in the engine, and light body repairs involving straightening, welding, sanding, or painting. The M1A1 tank is designed to take advantage of its fault isolation and component replacement capability. In the engine compartment, for example, the following components are replaceable without removing the power pack:

- Starter
- Fuel Control
- Ignition Components
- Hydraulic Pump
- Air Filter
- Oil Filter
- Fuel Filter
- Cooling Fan
- Cooling Fan Drive
- Alternator

Removal and reinstallation of the power pack at the intermediate level can be accomplished using the battalion's M88A1 recovery vehicle, or 5-ton wrecker. All fluid, electrical, and mechanical interfaces use quick-disconnect hardware and are functionally grouped to facilitate removal and reinstallation of the power pack. For simplicity, efficiency, and readiness considerations, faulty power packs may be replaced as entire units and subsequently fault-isolated and repaired.

b Main Gun and Other Vehicle-Mounted Weapons. Maintenance consists of fault diagnosis and piece-part replacement.

c Vehicle-Mounted Radio equipment. Maintenance consists of diagnosis and repair of components within the fault capability of assigned Test, Measurement, and Diagnostic Equipment (TMDE) and replacement and repair of lowest replaceable items

d Fire Control System. Maintenance consists of diagnosis/fault isolation, replacement, and subsequent repair of components.

2 Fourth Echelon. Fourth-echelon maintenance will be performed by the supporting FSSG through equipment evacuation to the FSSG or contact teams from the FSSG. The principal function of fourth-echelon maintenance is to repair subassemblies, assemblies, LRU's, and major items for return to ready-for-issue status. When the nature of the defect and operational commitments require, Operational Readiness Float (ORF) exchange will be used. Fourth-echelon maintenance functions consist of:

ENCLOSURE (1)

a Diagnosis and fault isolation of malfunctions to the internal piece-part level; adjustment, alignment, and repair, as necessary, for restoration to required tolerances or standards.

b Replacement of defective modular components which are beyond the authorized capability of lower echelons of maintenance.

c repair of major modular components by grinding, adjusting, or aligning such items as fuel pumps, transmission cross drive, and brakes.

d Repairing modular components by replacing internal and external piece parts. This includes such components as the telescope and cable assembly of the GPS.

e Performance of hull and turret repair, including steel and aluminum welding, machine cutting, pressing, shearing, sanding, and painting.

(c) Depot Level. Maintenance procedures applicable to depot-level operations are performed in accordance with Depot Maintenance Work Requirements (DMWR's) and Technical Data Packages (TDP's). Depot-level maintenance and fifth-echelon maintenance are synonymous. Unserviceable major components, test sets, and end items undergo repair or refurbishment (overhaul, rebuild, or Inspect and Repair Only As Necessary (IROAN)) at depot.

1 Components requiring special equipment and technology, alignment fixtures, and/or other special high-value resources, which cannot be economically justified at an intermediate level of field maintenance, are repaired at depot. For example, defective printer circuited boards are removed/replaced at intermediate level and returned to depot for repair. Recoverable items will be handled in accordance with MCO P4400.82, "Regulated/Controlled Item Management Manual." Due to the modular nature of the M1A1, the majority of depot work will be directed toward repair of Secondary Depot Repairables (SDR's).

2 Short of catastrophic incident or accident involving damage to the chassis and/or turret structures, the vehicle should not require fifth-echelon level end-item refurbishment. The Maintenance Directorate, MCLB, Albany, will establish and implement a CVE program. Accordingly, no end-item refurbishment cycle is established based strictly on hours, miles, or time-in-service criteria. A Combat Vehicle Evaluation (CVE) program, however, will be utilized to inspect and validate vehicles as candidates for depot refurbishment. The Maintenance

ENCLOSURE (1)

Directorate, MCLB, Albany (Code 88) will establish and implement a CVE program. Vehicles selected for refurbishment will be sent to depot for IROAN.

3 MCLBs will not facilitate for M1A1 maintenance. Accordingly, CG, MCLB, (Code 88) Albany will negotiate an umbrella DMISA with the U.S. Army for all M1A1 SDR's.

(5) Maintenance Personnel. Table 2 reflects personnel/skills necessary for maintenance of the M1A1.

Table 2.--Maintenance Personnel.

b. Contractor Support

(1) Depot. Contractor depot support will not be utilized. However, contractor support will be utilized to assist in the training of key depot maintenance personnel.

(2) M1A1 Fielding. contractor Field Service Representative (FSR) support from General Dynamics Land Systems (GDLS) and Textron will be utilized to support NET, assist the MFT to deprocess and issue M1A1's, and provide post-fielding on-site support (first through fifth echelon maintenance and supply) as reflected below. All FSR costs will be borne by CG, MCRDAC.

ENCLOSURE (1)

(a) Deprocessing, NETT, and 3d Tank Battalion support at MCAGCC from 1 November 1990 through 30 September 1992:

1 GDLS Site Supervisor(1)
1 GDLS System Technician
1 GDLS Test Set Technician
1 Textron Engine Technician

Note 1: Site Supervisor arrives and opens office
1 November 1990.

(b) Mobile FSR team to support deprocessing/fielding at scheduled sitesy from 1 June 1991, through 29 March 1992:

1 GDLS Supervisor
1 GDLS System Technician
1 GDLS Test Set Technician
1 Textron Engine Technician

Note 2: MCB, Camp Lejeune, NC: 1 June 1991 to 31 July
1991 MCLB, Albany, GA: 1 September 1991 to 29
March 1992

(c) Post-fielding, on-site support at MCB, Camp Lejeune, NC from 1 June 1991 to 30 June 1992.

1 GDLS System Technician

(3) U-COFT. Regional, on-call FSR support will be available for each system. The FSR will perform second-echelon maintenance and above on the U-COFT, as required. Gaining commands must provide their own Instructor-Equipment Operator (I-EO) and perform first-echelon maintenance. System support will be borne by CG, MCRDAC.

(4) M-COFT. A regional contractor FSR will accompany each M-COFT to install/remove the system and will be on call to perform second-echelon maintenance and above. The gaining command is responsible for first-echelon maintenance. System support will be borne by CG, MCRDAC.

(5) Maritime Prepositioning Ships (MPS). Maintenance of MPS stocks, up to and including fourth echelon, will be performed by a vendor contracted by the CG, MCLB, Albany, GA.

c. Manpower, Personnel, and Training

(1) Personnel Requirements. There will be no changes in the number of tank crewmen needed to operate the M1A1. The four-man crew consists of: tank commander, gunner, loader, and

driver. There will, however, be adjustments to organizational structures.

(a) Tables of Organization (T/O's)

1 Changes. Manpower savings, within gaining commands, resulting from the decrease from five to four tanks per platoon are partially offset by an increase in requirements for support personnel. The following T/O's are affected by the transition from the M60A1 R/P to M1A1:

<u>T/O No.</u>	<u>T/O No.</u>	<u>Unit</u>
<u>M60A1</u>	<u>M1A1</u>	
4233M	4234G	Tank Company, Tank Battalion
4657M		H&S Company, 1st Armored Assault Battalion
4237Q	4237G	H&S Company, Tank Battalion (3 companies)
4237P		H&S Company, Tank Battalion (4 companies)

The M1A1 T/O's are delineated in appendix B.

2 Implementation. In order to minimize organizational and personnel turbulence, battalion conversion to the four-tank platoon will occur concurrently with placement of the M1A1 into service.

(b) Military Occupational Specialties (MOS's)

1 Changes. Two new MOS's (1812 and 2146) have been created attendant to the fielding of the M1A1. MOS 1812 (M1A1 Tank Crewman) will be awarded to crewmen who successfully complete M1A1 NET or an appropriate formal school at the U.S. Army Armor Center (USAARMC), Ft. Knox, KY. MOS 2146 (M1A1 Tank Mechanic) will be awarded to mechanics who complete an appropriate formal school at USAARMC. MOS's 1812 and 2146 will not be assigned by virtue of on-the-job training (OJT).

2 Implementation. MOS's 1812 and 2146 will be reflected as primary MOS's. MOS's 1811 and 2145 will be reflected as additional MOS's and not deleted until such time as M60A1 R/P phaseout is complete. Instructions pertaining to the deletion of MOS's 1811 and 2145 from personnel records and the Manpower Management System (MMS) will be the subject of separate correspondence.

(2) Training

(a) Approach. The Marine Corps approach to M1A1 tank training is to adapt the Army's training programs for Marine Corps use. The Marine Corps will rely on the Army school system for the institutional training of tank crewmen and maintenance

ENCLOSURE (1)

personnel. For transition training, the Marine Corps will adopt the Army's current materiel fielding concept which includes NET. The concept of M1A1 NET is equipment-oriented, "hands on" training. Training criteria are referenced with performance evaluation of the "go/no go" variety. An all Marine NETT will train active and Reserve forces at MCAGCC. The NETT will provide training in individual and crew member operations and maintenance; collective training in crew operations, gunnery, and operational techniques; U-COFT instruction; DWFK installation training; and use of the M1 Mine Clearing Blade.

(b) Retraining. Table 3 reflects retraining requirements attendant to M1A1 fielding.

Table 3.--Retraining Requirements.

<u>MOS</u>	<u>TITLE</u>	<u>TRAINING REQUIRED</u>
1316	Metal Worker	MOJT
1802	Tank Officer	MOJT
1811	Tank Crewman	Yes
1812	Tank Crewman (M1A1)	No

2805	Data/Communications Maintenance Officer	No
2811	Telephone Technician	No
2841	Ground Radio Repairer	No
2861	Radio Technician	No
2871	TMDE Technician	MOJT
2874	Metrology Technician	MOJT
2891	Data/Communications Maintenance Chief	No

(c) NET (Active Forces)

1 Marine Corps NETT. The mission of the NETT is to train tank crewmen to the level of confidence, at individual and crew duties, in all equipment-related areas of operations, maintenance, and gunnery. The NETT members were identified and commenced their individual training in October 1988. All NETT members completed their individual training in July 1989, and executed permanent change of station orders to Ft. Carson, CO, in

ENCLOSURE (1)

August 1989. While at Ft. Carson (from September 1989 to June 1990), the Marine Corps NETT participated with the U.S. Army NETT in the transition of the 4th Infantry Division (Mechanized) from the M60A3 to the M1A1, and attended M1 to M1A1 rollover training at Ft. Riley, KS. Subsequently, the Marine NETT will execute a unit move to MCAGCC, establish NETT facilities, and prepare to initiate Marine Corps tank company NET cycles. The composition of the NETT is shown in table 4.

@ Report to Naval Hospital, MCAGCC.

4 Advance Party. Five days prior to the commencement of its NET, the tank company will furnish an advance party to coordinate support and training preparation with CG, MCAGCC and the OIC, NETT, respectively. The advance party will consist of:

<u>BILLET</u>	<u>QTY</u>	<u>GRADE#</u>	<u>MOS</u>
Company Executive Officer	1	Lt	1802
Tank Leader	1	MSgt	1811
Maintenance Chief	1	GySgt	2146
Infantry Weapon Repairer	1	Cpl	2111
Ground Radio Repairer	1	LCpl	2841
Tank Crewman	1	Cpl	1811

ENCLOSURE (1)

<u>BILLET</u>	<u>QTY</u>	<u>GRADE#</u>	<u>MOS</u>
Tank Crewman	4	LCpl/below	1811
Property NCO	1	Sgt	3051
Automotive Mechanic%	1	Cpl	3521

Appropriate grade substitutions are authorized.
% Augmentee (H&S Co)

5 Length. Each NET evolution is 29 training days (39 calendar days).

6 Location. All NET for active and Reserve forces will be conducted at MCAGCC.

7 Content

a Individual Training. The purpose of individual training is to transition drivers, loaders, gunners, and tank commanders from the M60A1 R/P to the M1A1. The program of instruction consists of driver's training and turret training. Driver training will emphasize M1A1 safety, fire prevention, driver's station operation, hull PMCS, emergency procedures (to include troubleshooting the engine and transmission), and day and night driving proficiency. Turret training will emphasize station operations for the tank commander, gunner, and loader; fire prevention; turret PMCS; pre-/post-firing checks and services; and boresighting/zeroing tank-mounted weapons.

b Conduct-of-Fire Training. Two U-COFT's will be located at MCAGCC to support NET. The U-COFT (figure 8) is a tank gunnery training device for the M1A1 commander-gunner teams. The U-COFT places the tank commander and gunner in realistically simulated crew stations and presents them with a full range of target engagement situations controlled by an Instructor-Operator. The result is challenging, progressive gunnery training despite range, time, and funding constraints. Conduct-of-fire training utilizing the U-COFT will be integrated with NET collective training to introduce tank crewmen to the U-COFT and to accelerate attainment of crew firing proficiency. Priority of use for the U-COFT's at MCAGCC will go the NETT.

c Collective Training. The purpose of collective training is to train tank crews in a series of exercises which will enable them to effectively engage targets with tank-mounted weapons, and to standardize crew duties. Crew training will encompass conduct-of-fire and U-COFT exercises, crew drill training, crew subcaliber training device exercises, boresighting and zeroing tank-mounted weapon systems, live-fire gunnery training on tank tables, and a qualification gunnery exercise on Tank Table VIII (FM 17-12-1).

ENCLOSURE (1)

d Maintenance Training. FSR's, supplementing the NETT, will provide reinforcement training for tank mechanics. The NETT Maintenance Officer and Maintenance Chief will supervise tank mechanics during NET, evaluate training given to the unit mechanics, and provide follow-on training, if needed. Company maintenance personnel will maintain NETT tanks during their NET.

e Ancillary Equipment. The NETT will conduct training on installation, use, and maintenance of both the DWFK and the M1 Mine Clearing Blade.

8 Support

a A Memorandum of Agreement (MOA) between CG, MCRDAC and CG, MCAGCC defines the responsibilities and working relationship between the two parties for execution of M1A1 NET, as well as control and support of the NETT. A MOA between CG, MCRDAC and CG, 1st FSSG defines the responsibility of CSSD-12 in support of NET. Additionally, a Letter of Instruction (LOI) will be promulgated for each NET evolution to assign responsibilities and define relationships between commands undergoing NET and both CG, MCRDAC and CG, MCAGCC.

b An MOA between CG, MCRDAC and CG, 1st FSSG provides the basis for the following support furnished at MCAGCC: dining facility; billeting; medical; dental (emergency only); religious services; AUTODIN message traffic; postal; transportation for administrative exigencies; and morale, welfare, and special services (exchange, commissary, laundry, barber shop, hobby shops, library, athletic facilities, and all clubs).

9 Administration

a Fitness reports attendant to NET will be prepared in accordance with MCO P1610.7, "Performance Evaluation System."

b Leave will be granted to personnel undergoing NET on an emergency basis only.

c Disbursing services will not be provided at MCAGCC.

d Units undergoing NET will not be required to furnish messmen to a dining facility.

ENCLOSURE (1)

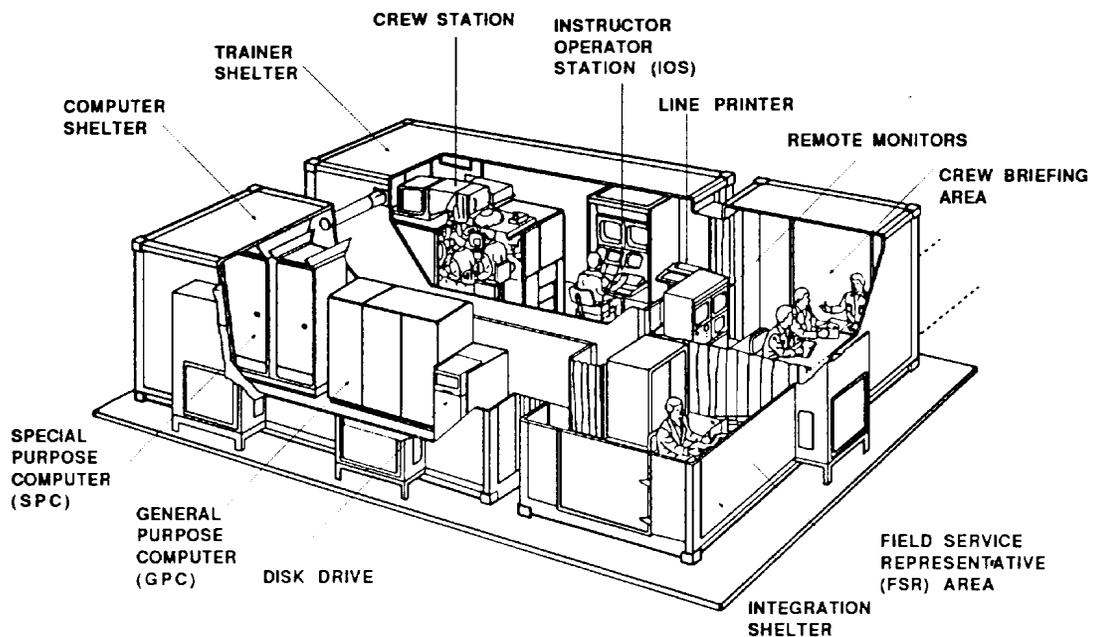

Figure 8.--U-COFT.

e Personnel undergoing M1A1 NET are eligible to stand duty watches during non-training hours.

f The gaining command will provide CG, MCRDAC (CBGT/PSL-T), info CMC (MM) and CG, MCAGCC, with a roster of all personnel (name, grade, SSN, MOS, and tank crew number (operators only)) slated to attend NET at least 30 days prior to the evolution. Changes thereto will be appropriately coordinated with all concerned.

g Upon successful completion of M1A1 NET at MCAGCC, the NETT administrative section will prepare and award a graduation certificate/diploma to each graduate. The graduates parent command will make appropriate Service Record Book/MMS entries to reflect successful completion of M1A1 NET.

ENCLOSURE (1)

h Licensing of individuals subsequent to successful completion of NET will be accomplished by the parent command in accordance with local licensing procedures.

10 Funding. Temporary Additional Duty (TAD) expenses for active units undergoing NET will be borne by CG, MCRDAC (CBGT), via Operations and Maintenance, Marine Corps (O&MMC) funding. CG, MCRDAC (PSL-T) will provide appropriation data and coordinate transportation requirements in support of NET.

11 Equipment. Individual and organizational equipment requirements for NET are contained in appendixes C and D.

12 Schedule. The M1A1 NET schedule is reflected in appendix E.

(d) NET (Reserve Forces)

1 Marine Corps NETT. The mission of the NETT will remain unaltered insofar as training Reserve personnel is concerned.

2 Eligibility. Reserve Marines whose Expiration of Current Contract (ECC) date is at least 30 days after completion of NET may attend.

3 Composition. The composition of tank companies (supported by FMFPac personnel) for NET, including the advance party, is shown below. Reserve tank company I-I Staffs will attend NET concurrently with their respective Reserve units. Other personnel may be integrated into Reserve NET cycles depending upon the availability of quotas.

TANK COMPANY

<u>MIN</u>	<u>MAX</u>	<u>MOS</u>	<u>DESCRIPTION</u>
2	5	1802	Tank Officer
1	1	0411	Maintenance Management Specialist

& Report to CSSD-12 MIP

* One refueler operator and two with ammunition licenses.

@ Report to Naval Hospital, MCAGCC.

4 Advance Party. Three days prior to the commencement of NET, the tank company will furnish an advance party to coordinate support and training preparation with the CG, MCAGCC and the OIC, NETT, respectively. The advance party will consist of the tank company I-I Staff and the following Reservists:

<u>BILLET</u>	<u>QTY</u>	<u>GRADE</u>	<u>MOS</u>
First Sergeant	1	1stSgt	9999
Property NCO	1	Sgt	3051
Infantry Weapon Repairer	1	Cpl	2111

* Appropriate grade substitutions are authorized.

5 Length. Each NET evolution is 29 training days (39 calendar days).

6 Location. All NET for Reserve forces will be conducted at MCAGCC.

7 Content. The content of Reserve NET is identical to that of the active forces.

8 Support. The support parameters delineated for active forces shall remain in effect for Reserve units undergoing NET.

9 Administration

a Fitness reports attendant to NET will be prepared in accordance with MCO P1610.7.

ENCLOSURE (1)

b Disbursing services will not be provided at MCAGCC.

c Units undergoing NET will not be required to furnish messmen to a dining facility.

d Personnel undergoing M1A1 NET will not be assigned to duty watches.

e The CG, 4th Marine Division will provide CG, MCRDAC (CBGT/PSL-T), info CMC (MO) and CG, MCAGCC, with a roster of all personnel (name, grade, SSN, MOS, and tank crew number (operators only)) slated to attend NET at least 30 days prior to the evolution. Changes thereto will be appropriately coordinated with all concerned.

10 Funding. Annual Training Duty (ATD) NET-related expenses for units undergoing M1A1 transition will be borne by CG, MCRDAC (CBGT), via O&MMC funding. CG, MCRDAC (PSL-T) will provide appropriation data in support of NET.

11 Equipment. Individual and organizational equipment requirements for NET are contained in appendixes C and D.

12 Schedule. The M1A1 NET schedule is reflected in appendix E.

(e) Institutional Training. The Marine Corps will utilize schools at the USAARMC, Ft. Knox, KY, and the U.S. Army Ordnance Center and School (USAOC&S), Aberdeen Proving Ground, MD, for entry-level training and subsequent skill progression training. Commencing in January 1990, all Marines attending entry-level armor crewman training will receive M1A1 training and be assigned MOS 1812. Commencing in October 1990, all Marines attending entry-level tank-peculiar repair training will receive M1A1 training and be assigned MOS 2146. M1A1 instruction for intermediate-level maintenance will commence 1 October 1990. Appendix F contains pertinent data on available institutional courses of instruction. Requests for school quotas, if required, should be made through normal channels.

(f) U-COFT. The U-COFT is a powerful tool for armor trainers at all levels. The Marine Corps has procured four U-COFT's which will ultimately be located at MCAGCC and Camp Lejeune. The U-COFT is housed in three isorigid, air-conditioned shelters, each occupying 159 fty (19.9-feet by 8-feet by 8-feet). The total system weights 27,660 pounds. Maintenance (above first echelon) on the U-COFT will be performed by an on-call contractor FSR for the life of the system. Table 5 shows the U-COFT delivery/ready for training schedule dates.

ENCLOSURE (1)

Table 5.--U-COFT Delivery/Ready For Training Schedule.

<u>T/E No.</u>	<u>UNIT TITLE</u>	<u>QTY</u>	<u>DATE</u>
N1531	H&S Co, 3d TkBn	2	Jul-Aug 1991
N1521	H&S Co, 2d TkBn	2	Jul-Aug 1991

(g) M-COFT. The M-COFT has the identical capabilities and power requirements as the U-COFT. The M-COFT, however, is trailer-mounted to facilitate system mobility. The Marine Corps will procure two M-COFTs for use by the Reserves. Figure 9 depicts a typical layout for the M-COFT. Table 6 depicts the M-COFT delivery schedule.

Table 6. --M-COFT Delivery Schedule.

<u>Unit</u>	<u>QTY</u>	<u>DATE</u>
Tank Co, West Coast	1	Jun 1992
Tank Co, East Coast	1	Jul 1992

(h) Depot Maintenance Training. As the Marine Corps will not perform M1A1 depot-level maintenance, there are no depot maintenance training requirements.

(i) Maritime Prepositioning Shipping (MPS) Training. The CG, MCLB, Albany, has overall responsibility for training MPS maintenance personnel. CG, MCRDAC (CBGT) will assist with M1A1 driver training by providing an M1A1 tank and instructors. MCLB, Albany will issue M1A1 tank individual drivers licenses upon successful completion of the driving course. CG, MCRDAC (PSL-T) will coordinate driver training.

(j) Training Publications. The following references contain myriad information which may assist in establishing and maintaining appropriate training:

FM 17-12-1	Tank Combat Tables, M1
FM 17-12-7	Tank Combat Training Devices
FM 17-15	Tank Platoon
FM 25-2	Unit Training Management
FM 25-3	Training In Units
FM 25-4	How To Conduct Training Exercises
FM 25-5	Training For Mobilization And War
FM 25-7	Training Ranges
FM 71-1	Tank And Mechanized Infantry Company Team
FM 71-2	Tank And Mechanized Infantry Battalion Task Force
FM 71-3	Armored And Mechanized Infantry Brigade
FM 71-100	Armored And Mechanized Division Operations

ENCLOSURE (1)

d. Supply Support

(1) General. The supply support program is designed to provide timely acquisition, provisioning, and inventory replenishment of system/ancillary equipment components, spares, repair parts, and consumable supplies necessary to maintain the M1A1 in a high state of readiness. The fleet readiness goal is 85 percent for the M1A1, a combat essential item of equipment.

(2) Supply Concept. The procedures set forth in this MFP will govern the initial distribution of end items; spares/repair parts; special tools; special purpose test equipment; technical manuals; and other ancillary equipment required to operate and maintain the M1A1. The U.S. Army Tank-Automotive Command (TACOM) is designated the PICA for the M1A1. The Marine Corps (MCLB, Albany) is designated the Secondary Inventory Control Activity (SICA). MCLB, Albany is responsible for all provisioning, cataloging, and loading the Master Header Information File (MHIF) with the Principal End Items (PEI) and all associated equipment, i.e. special tools, test sets, collateral equipment. Fielding will be accomplished via the TPF concept originated by the U.S. Army. Both the MFT's Deprocessing Team and contractor FSR's under the purview of the APM, Tank Systems Branch, Ground Weapons (CBGT), MCRDAC, will be available to furnish assistance and resolve problems that occur during the deprocessing period. For sustainment, standard requisitioning/supply procedures Military Standard Transaction and Issue Procedures (MILSTRIP)/SASSY will be utilized. Field commands will be furnished with O&MMC (New Equipment) funding for their first year of M1A1 operation.

(3) Total Package Fielding

(a) Under the TPF concept, the materiel fielder/executor (MCRDAC/TACOM) assume additional responsibilities to relieve gaining commands of much of the logistics burden previously associated with the fielding process. The materiel fielder develops, plans, and procures the materiel system and all its support; coordinates materiel requirements with the gaining command; consolidates and packages support; delivers; deprocesses; trains; performs a joint inventory at handoff; and provides documentation for materiel to be posted to unit records.

(b) Initial spares/repair parts (60 day allocations will be delivered, inventoried (with MCRDAC/GDLS/MCLB, Albany assistance), and loaded approximately 30 days prior to

ENCLOSURE (1)

deprocessing. TPF includes concurrent deprocessing/handoff of the M1A1 and its other associated support packages:

- 1 All component major items, ancillary equipment, and collateral materiel.
- 2 Special purpose tool sets.
- 3 Special purpose test equipment.
- 4 Special mission kits/equipment.
- 5 Starter set of technical publications.
- 6 Customer documentation.

(c) The fielding command (MCRDAC) is responsible for assuring the successful fielding and initial supportability of the M1A1. The fielding command has herein identified items and actions required to initially support the M1A1. Attainment of the following items, however, is the responsibility of the gaining command:

- 1 Expendable supplies and materiel (Class II).
- 2 Bulk petroleum products and chemicals (Class III).
- 3 Conventional ammunition (Class V).

(d) The materiel fielder's responsibilities are:

- 1 In coordination with MCCDC, identify the total materiel, facility, personnel, and training requirements.
- 2 Coordinate total materiel, facility, personnel, and training requirements with the gaining commands.
- 3 Program and budget funds to accomplish all scheduled TPF.
- 4 Coordinate project code(s) and provide instructions to gaining commands pertaining to TPF.
- 5 Procure requisite Class II, Class VII, Class IX, and technical publications.
- 6 Establish and maintain accountability and visibility records for all TPF assets until handoff.

ENCLOSURE (1)

7 Provide a starter set of technical publications.

8 Coordinate identification of delivery, storage, staging, inventory, deprocessing, and handoff sites for the system with the executor (TACOM) and gaining commands.

9 Coordinate with gaining commands to ascertain that adequate Class II expendables, Class III, and Class V will be available.

10 Ensure that the gaining commands are apprised of ammunition requirements. Advise gaining commands of the level of war reserve stocks available (in days of supply) to support weapons fielded.

11 Advise the gaining command of the percent of fill for packages and identify back-ordered items/expected date for delivery. Coordinate with gaining command prior to movement of materiel to gaining command facility.

12 Verify handoff schedules, locations, and support needs.

13 Ensure that gaining commands understand the scope and duration of the services to be provided by the fielding command before, during, and after the handoff.

14 Coordinate shipping instructions for delivery, storage, staging, inventory, and handoff sites with gaining commands and executor (TACOM), as required.

15 Accomplish deprocessing to ensure that all materiel systems are operationally ready at the time of handoff.

16 Prepare a customer documentation package in user format. Prepare joint inventory documentation to include a listing of shortage items owed to the customer. Conduct a joint inventory of all packages with the gaining command prior to handoff.

17 Provide assistance to gaining units to assure establishment of user receipt, asset accountability, and visibility records for all TPF materiel.

18 Prepare and submit through proper channels Quality Deficiency Reports (QDR's) resulting from deprocessing, handoff, and NET.

ENCLOSURE (1)

19 Track fielding discrepancies and deficiencies for monitoring and analysis by:

a Department of Defense Activity Address Code (DODAAC).

b End item NSN.

c Unit identification code (UIC).

20 Maintain a file of lessons learned and initiate corrective actions to preclude recurrence of similar problems in subsequent fieldings.

21 Coordinate with supporting and gaining commands to ensure that NET requirements for all systems involved in the fielding are coordinated and accomplished.

(e) The gaining command responsibilities are:

1 Designate a single point of contact for fielding authority/responsibility and overall coordination with the fielding command.

2 Coordinate with all affected agencies to ensure that adequate support is provided throughout the fielding process.

3 Coordinate with the fielding command to determine all materiel, facility, personnel, and training requirements requisite for system fielding.

4 Ensure receipt of valid T/O and T/E documents to facilitate planning and effect necessary conversions.

5 Program, budget for, and requisition Class II expendables, Class III, and Class V.

6 Designate delivery, storage, staging, inventory, deprocessing, and handoff sites.

7 Verify and coordinate inventory, deprocessing, and handoff schedules, as well as personnel and materiel support to be provided by the gaining command.

8 Provide required personnel, materiel, facilities, and tools to assist in deprocessing and handoff.

9 Perform unit-level deprocessing of materiel such as cleaning, unit marking, and operator checks and maintenance.

ENCLOSURE (1)

20 Aug 91

10 Fill out and submit through proper channels any QDR's or warranty claims that may be appropriate.

11 Sign joint inventory forms and post necessary receipts and other accounting documentation at appropriate levels.

(f) To aid in implementation of TPF, a team from MCRDAC (CBGT) and TACOM will brief each gaining command on the entirety of the TPF concept approximately nine months prior to scheduled fielding (M1A1 delivery). The team will return to each gaining command approximately 6 months prior to fielding to effect coordination of all site-specific requirements and details.

(4) Supply Procedures for TPF

(a) Using Unit Procedures

1 All items being transferred during TPF will be jointly inventoried and inspected by the using unit, MCRDAC, MCLB, Albany and GDLs Logistics Center representatives of the MFT. Reports of Discrepancy (ROD's) (SF's 364) will be completed as required by GDLs representatives and verified by an official of the gaining command. A TPF report (inventory) will be provided to the unit by the MFT; this report will display both the authorized and delivered quantities of each item of supply.

2 The authorized quantities on the TPF report will be reconciled against the current Equipment Allowance File (EAF) and discrepancies reported to both the OIC of the MFT and the major command. Allowances for all items will be loaded to the unit's Mechanized Allowance List (MAL) as currently reflected on the EAF. (See UM 4400-124 paragraph 2.3.)

3 A "Receipt Not From Due" transaction (document identifier code (DIC) "D6A") will be processed for the quantities actually received. The document number assigned to these transactions will reflect the using unit Activity Address Code (AAC), the Julian date, and the document serial number indicated on the shipping documentation. The supplementary address will be left blank. A "Purpose Code Transfer" transaction (DIC "DAD") will be processed to move the items from purpose code "A" to purpose code "C". A "no cost" Job Order Number (JON) will be assigned to these transactions and the document numbers assigned will match those on the corresponding receipt transactions.

4 The Reporting Unit Allowance File (RUAF) should be updated as appropriate using the procedures described in UM 4400-124 paragraph 2.5. This must be completed immediately

ENCLOSURE (1)

upon arrival of end items to facilitate use of MIMMS during deprocessing.

(b) Supporting Unit Procedures

1 Class IX repair parts, both consumable and reparable, will be delivered to the designated issue point by the MET. The OIC of the SMU will ensure that the appropriate issue points are designated to provide support to both the using unit and the MFT during equipment deprocessing. In those instances where a using unit issue point is to receive reparable items, a contact team from the main float will assist in the joint inventory of the items at the issue point in order to expedite the loading of assets to appropriate accounting records. Items must be made available for issue no later than the start of deprocessing. Due to the unique nature of TPF, some of the procedures outlined herein may differ from the guidance contained in MCO 4400.150, MCO 4400.151, UM 4400-123, and UM 4400-124. In these instances, the procedures described herein will take precedence.

a The 1st FSSG will be provided with two Class IX packages; one to support the NETT and one to support the 3d Tank Battalion. The 2d FSSG will be provided with one Class IX package to support 2d Tank Battalion. Project code I50 applies to all Class IX packages. The packages contain only Garrison Operating Level (GOL) stocks. No Initial Issue Control File (IICF) will be produced for project I50, and normal provisioning project reporting requirements are waived. Upon receipt by the issue points, stock levels will be protected during the demand development period in the same manner as other provisioning projects.

b The CG, MCLB, Albany will provide SMU's and designated issue points with NSN's, document numbers, and quantities expected to be received in Class IX blocks. If desired, issue points may load these items to SASSY files as dues. DIC "ZBE" transactions citing the RIC of the general account and control code "3" or "4" should be used. The issue point's AAC must be substituted for the AAC contained in the original document number, and the document's date and serial number retained. Additionally, DIC "AE1" status transactions should be inducted containing status code "BA" in order to preclude automatic follow-up transactions from being generated.

c Standard MIMMS procedures will be used to support deprocessing. A unique JON will be assigned to capture deprocessing costs. Priorities on all requisitions incidental to deprocessing will be under Force/Activity Designator (F/AD) "II" or "III" and Urgency of Need Designator "A" as identified in MCO 4400.16, "Uniform Materiel Movement and Issue Priority System

ENCLOSURE (1)

(UMMIPS)." Upon completion of deprocessing, standard UMMIPS priority codes will be used. Liaison with SMU operations should be maintained to assign source of supply codes to balance file records that will support this priority for replenishment requisitions. When dues are preloaded, receipt from due transactions DIC "DGT" should be used instead of DIC "D6A" indicated in the instructions below.

2 Repairable Item Procedures

a The total authorized quantity for each stock number will be loaded to the main float as a provisioning allowance reflecting the current date as the provisioning date on a DIC "YGB" transaction.

b A "Receipt Not From Due" transaction (DIC "D6A") will be used to receipt for the items citing the main float or using unit issue point, as appropriate, in the document number. The document date and serial number will match those on the shipping documentation.

c In the case of controlled items, "Controlled Items Allowance Change" transactions (DIC "WAA") will be prepared and transmitted to MCLB, Albany, GA. Arrangements should be made with the SMU Operations Officer to ensure that these transactions are transmitted by electronic means.

3 Consumable Item Procedures

a The total authorized quantity for each stock number will be loaded to the Reorder Objective (RO) and/or Minimum Stockage Level-Reorder Objective (MSL-RO) fields of the General Account Balance File/Loaded Unit Balance File (GABF/LUBF) in accordance with the current edition of UM 4400-1233 or UM 4400-124 as appropriate.

b A "Receipts Not From Due" transaction (DIC "D6A") will be used to receipt for the items as described above.

4 Class IX items are provided to the issue points concurrently with end item fielding in order to ensure availability of spares during deprocessing. It is imperative that these items are situated so as to be readily available to the MFT during deprocessing operations.

5 In order to monitor the cost associated with M1A1 deprocessing, all issues of these items and repair of maintenance float items will cite a unique JON. The total charges incurred will be reported to the OIC of the MFT.

ENCLOSURE (1)

(c) NETT SUPPORT. NETT assets will be deprocessed and supported in a similar fashion to all "battalion sets."

1 The CG, FMFPac will provide the following in support of NET:

- a Augmentation team and Reserve tank companies.
- b A reimbursable JON.
- c An ERO matrix for MIMMS processing.
- d Supply and maintenance (third and fourth echelon) support.

2 The NETT will be assigned its own Department of Defense Activity Address Code (DODAAC).

(5) Tables of Equipment (T/Es). T/Es for M1A1-equipped units are contained in appendix G.

(6) Components of the M1A1

(a) Components of the M1A1 fall into three categories:

1 Supply System Responsibility. Items that are furnished with and must be turned in with the end item. Any item requiring replacement is the responsibility of the holding unit.

2 Collateral Materiel. Items that are supplied with the initial issue of the end item and are retained by the unit. Collateral materiel (referred to by the U.S. Army as basic issue items) and supply system responsibility items will be shipped overpacked with the M1A1.

3 Using Unit Responsibility. Items that are not issued with the end item. They must be requisitioned, as required, through the supply system by the using unit or holding organization.

(b) **Appendix H** contains a component checklist for the M1A1.

(c) **Appendix I** contains a listing of component materiel on equipment repair parts.

(7) Class II (Expendables). Bulk and package Class II supplies associated with the M1A1 are listed in appendix J. They

ENCLOSURE (1)

will not be furnished under the TPF concept and must be requisitioned.

(8) Class III (POL). These supplies will be obtained by the gaining unit under existing procedures. Appendix K lists the associated M1A1 POL products required to be on hand.

(9) Class V (Ammunition). Support for ammunition will continue to be promulgated in accordance with MCO 8010.1, "Class V (W) Supply Rates for FMF Combat Operations," and MCO P8011.4, "Marine Corps Table of Allowances for Class V (W) Materiel (Peacetime)." Detailed information regarding the M1A1 family of ammunition is found in appendix L. Ammunition will not be provided under the TPF concept. Tank companies are allocated ammunition to conduct two gunnery exercises (Tank Tables I through VIII) annually. Each company will fire one of its two allocations at NET. The other will be used for sustainment training at the home station.

(10) Class VII (Secondary Weapons). all secondary weapons (machineguns, rifles, and grenade launchers) are listed in appendix G. MCLB, Albany is tasked to convert 296 machineguns .50 cal M2 (Purpose Code "E") to machineguns .50 cal M2 turret type (M48) (Purpose Code "A") to support fielding. All machineguns, M240 and M2, will be furnished (pushed) by MCLB, Albany. M257 grenade launchers will be a part of the TPF items and will be delivered with the TPF for application during deprocessing by the MFT. M16A2 rifles are the responsibility of the using unit. A delivery schedule for machineguns is contained in annexes I and II of appendix M. All secondary weapons will be accounted for in accordance with MCO P4400.150, "Consumer Level Supply Policy Manual," and MCO 8300.1, "USMC Serialized Control of Small Arms System."

(11) Class IX

(a) Initial Spares/Repair Parts Packages. Upon receipt of a funded Military Interdepartmental Purchase Request (MIPR) from CG, MCLB, Albany, the Program Manager (PM), ABRAMS Tank Systems, TACOM, will requisition the initial spares/repair parts package contents under project code I50 to coincide with fielding of Marine Corps battalion sets. The SMU will be provided with appropriate data to load to the supply system at the time of fielding. Initial spares/repair parts packages will arrive prior to the M1A1 and other support packages at gaining commands. End items and the initial spares/repair parts packages will be jointly inventoried by the gaining command and the MFT. Initial spares/repair parts packages under TPF will contain consumables and reparable (Direct Exchange (DX) items) for loading to the general account and maintenance float, respectively. The MFT will, however, be granted full access to

ENCLOSURE (1)

the initial spares/repair parts package during each deprocessing evolution. An allotment of \$2,500 (O&M, New Equipment) per tank has been established to reimburse gaining commands for potential Class IX consumed by the MFT during deprocessing. The content of initial spares/repair parts packages to support each active tank battalion is contained in appendix N, ; the content of the initial spares/repair parts packages to support each MPS is listed in appendix N, annex II.

(b) Replenishment. Replenishment will be conducted through normal budgeting, funding, and MILSTRIP/SASSY procedures.

e. Support Equipment

(1) General. The equipment listed herein is required for the operation and maintenance of the M1A1 Tank. Unless annotated otherwise, all special tool sets and special purpose test equipment will be furnished (pushed) during the fielding period to arrive concurrently with the M1A1.

(2) Requirements

(a) Special Tools

<u>Echelon</u>	<u>Nomenclature</u>	<u>TAMCN</u>

ENCLOSURE (1)

(c) Vest and Connector, Conditioning, Microclimatic.
Appendix Q

(4) Components

(a) Special Tool Sets. Appendix R

(b) Special Purpose Test Equipment

1 STE-M1. The STE-M1 (figure 10) is an automated electronic test set used primarily to troubleshoot the electrical systems of the hull, turret, engine, transmission, stabilization, and fire extinguisher installations. It will fault isolate down to the LRU. The STE-M1 consists of core equipment and M1 equipment. Core equipment (NSN 4910-01-135-4389) is composed of three cases: Vehicle Test Meter (VTM)/Set Communication (SET COM), Controllable Interface Box (CIB), and cable case. M1 equipment (NSN 4910-01-142-2640) consists of four cases of adapters and cable assemblies to interface the set with the tank's LRU's and harness connectors. This equipment is used at the organizational level to check the functional operation of vehicle systems and troubleshoot malfunctions.

2 DSESTS-TIS. The DSESTS-TIS (figure 11a) is used at the intermediate level to fault-isolate defective components of LRU's removed from the tank. The tank system is automatically selected via electrical key coding within each LRU. DSESTS-TIS is a micro-computer controlled test device. Stored programs configured to support the M1A1 system control the sequence of operation, measurement and stimulus functions, and perform the test logic to isolate faults to a replaceable module/subassembly of an LRU. DSESTS-TIS consists of core equipment, M1 equipment, and TIS equipment. The core equipment (NSN 6625-01-236-0423) consists of an Operator Interface Unit (OIU) and a General Purpose Interface Assembly (GPIA). Three cable cases comprise the M1 equipment (NSN 6625-01-234-8163). The TIS equipment (NSN 4931-01-263-7972) is composed of two cases plus eight items of Government Furnished Equipment (GFE). A Power Supply PP-7545/U is necessary to provide appropriate current to the DSESTS-TIS. The DSESTS-TIS will be housed in the M934, 5-Ton Expandable Shop Van (figure 11b) which will be a collateral item to the DSESTS-TIS. The driver for the M934 will be incidental to the tank battalion maintenance platoon.

f. Technical Publications

(1) General. The Marine Corps will make maximum use of Army technical information, to include publications, drawings, specifications, packaging and preservation data sheets, quality

ENCLOSURE (1)

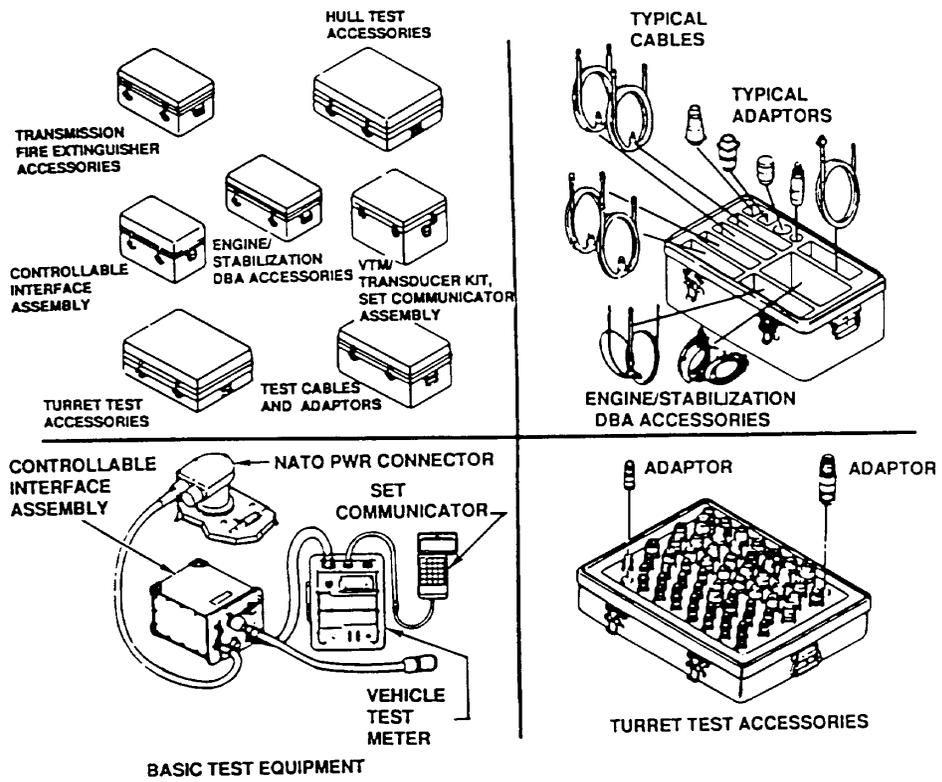

Figure 10.--STE-M1.

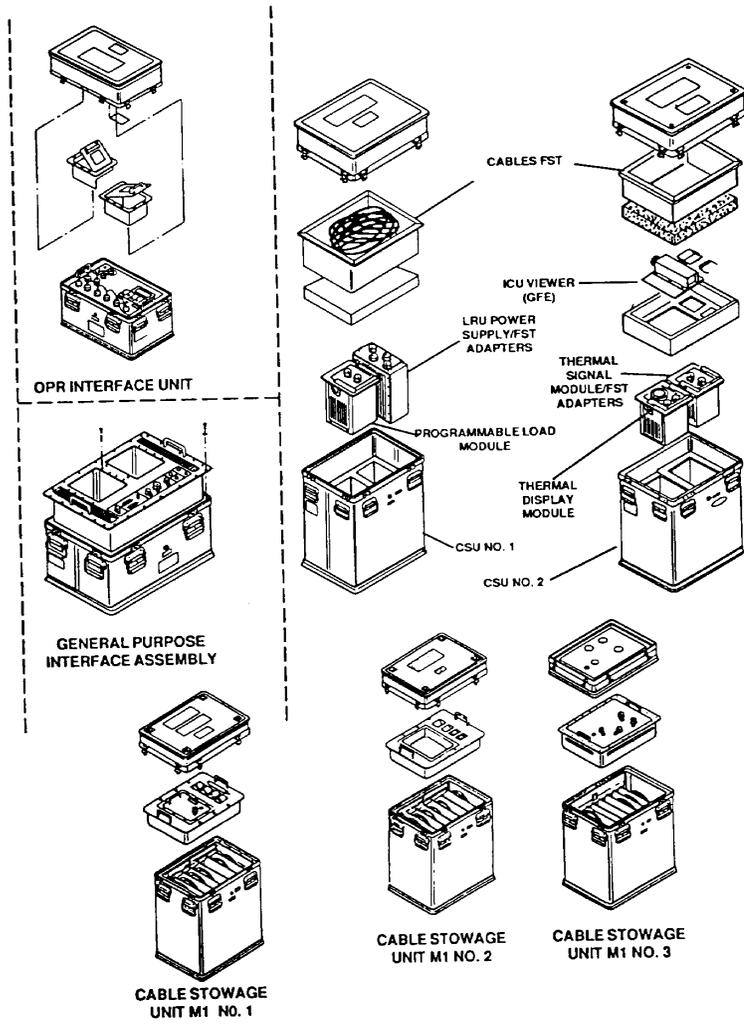

Figure 11a.--DSESTS-TIS.

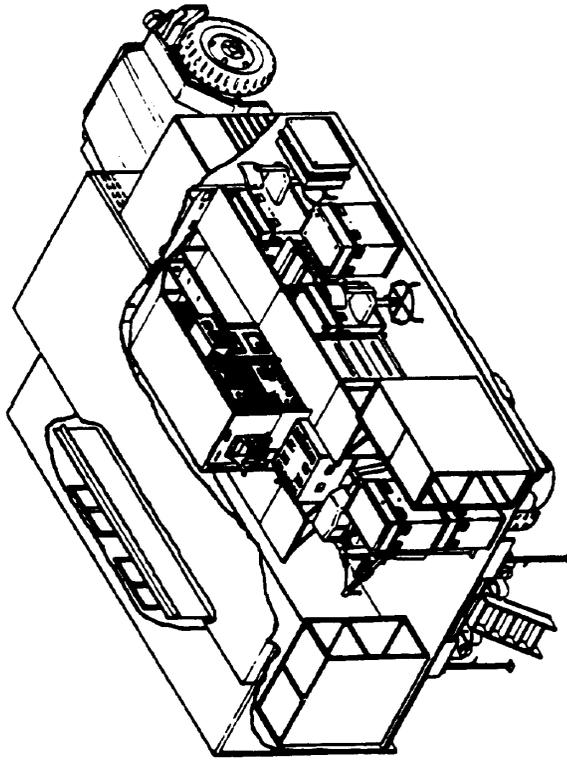

Figure 11b.--5T Expansible Shop Van Truck M934.

assurance provisions, equipment lists, repair parts lists, and inspection records.

(2) Manuals. The U.S. Army's TM's for the M1A1 and associated equipment will be used by the Marine Corps. Unique changes or deviations, if required, will be issued either as Alpha Marine Corps changes to the Army TM's or as Marine Corps TM's or addendums. Appendix S contains a listing of TM's associated with the M1A1. Publications will be pushed to gaining commands by pinpoint distribution prior to receipt of tanks. A starter set, consisting of two of each M1A1 peculiar manual, will be provided as part of TPF.

(3) DMWR's. The DMWR's listed in appendix T are currently in use for the M1A1.

g. Computer Resources Support

(1) M1A1. The U.S. Army Armament, Munitions, and Chemical Command/Armament Research, Development, and Engineering Center (AMCCOM/ARDEC) share responsibility as the Software Support Activity for the M1A1. Necessary software changes will be effected in the field by commercial contractor contact teams.

(2) U-COFT/M-COFT. AMCCOM is responsible for software support for the U-COFT and M-COFT. Software updates will be executed in the same fashion as that for the tank.

(3) STE-M1/DSESTS-TIS. TACOM (Program Executive Office, Armor Systems Modernization) is responsible for updating and supporting software for the test equipment. Updates will be effected at unit sites.

(4) Software Updates. Units will automatically receive updates as a part of the TPF concept.

h. Facilities. There are no unique facilities requirements associated with the M1A1. However, organizational, structural, and equipment/operational deviations associated with the conversion from the M60A1 R/P to the M1A1 influence facility considerations. Key comparisons with facilities impacts are:

<u>Supply (Per Tank)</u>	<u>M60A1 R/P</u>	<u>M1A1</u>
Fuel-Annual Peacetime Consumption	3230 gal	5043 gal
Fuel-Daily Combat Allowance	335 gal	586 gal
Main Gun-Annual Training Allowance	139 rds	188 rds

ENCLOSURE (1)

<u>Force Structure</u>	<u>Marine Tanks/Enlisted</u>	<u>Marine Tanks/Enlisted</u>
2d Tank Battalion	70/729	44/531
3d Tank Battalion	53/617	44/531
1st Armored Assault Battalion	34/482	
4th Tank Battalion	53/617	
8th Tank Battalion	70/729	
MPS (total)	159/90	

(1) Supply. Facility requirements for repair parts for the M1A1 are anticipated to be equal to that of the M60A1 R/P. However, different combat allowances and annual training allocations for fuel and ammunition will alter demands for storage in supply dumps and ships.

(a) Fuel Storage. Annual training requirements for the M1A1 are a function of consumption rates, numbers of operational tanks, and annual usage. Projected annual training requirements are based on consumption of 5043 gallons (850 miles @ 5.93 gpm, active) per tank per year. This amounts to 5,281 barrels of fuel per year per tank battalion. Combat fuel requirements are based on a worst-case 14.5 hour Battlefield Day (3.8 hrs idle, 5.6 hrs cross-country and 5.1 hrs. secondary roads. Expressed as a 30-day requirement, this amounts to 18,233 barrels per tank battalion.

(b) Ammunition Storage. Allowances contained in MCO 8010.1, "Class V (W) Support for FMF Combat Operations," and MCO P8011.4, "USMC Table of Allowances for Class V (W) Materiel (Peacetime)," are used to compute ammunition requirements.

Additional radiological controls are not required for the M829A1 Depleted Uranium (DU) tank round, as existing ammunition storage, handling, transportation, and accountability procedures adequately satisfy radiological safety concerns. Authorization for Navy and Marine Corps possession and storage of DU munitions is granted by Navy Radioactive Material Permit #1300164-L1NP. As conditions of this permit, firing of DU rounds for testing or training is not authorized at any Marine Corps installation. Any noncombatant firing of the M829A1 round must be performed at firing ranges or facilities specifically authorized to conduct such firings by a separate Nuclear Regulatory Commission (NRC) license or Navy Radioactive Material Permit. Changes in storage requirements are a function of four factors: two 7.62 mm machineguns per M1A1 vice one per M60A1 R/P; reduced quantity of tanks in the operational fleet; different allowances per tank; and an approximate 87 percent increase in the volume of packaged 120 mm cartridges vice 105 mm cartridges. Projected ammunition storage requirements for training reflect the annual requirement.

ENCLOSURE (1)

Storage requirements in Measurement Tons (MT's (40 ft(3))) for combat reflect 90-day requirements (60-days at the assault rate and 30-days at the sustaining rate) for active forces.

	<u>Training</u>	<u>Combat</u>
2d Tank Battalion	662 MT	1,183 MT
3d Tank Battalion	662 MT	1,183 MT
Reserve Tank Company	100 MT	

(2) Maintenance Shop Requirements. M1A1 characteristics should be checked against Naval Facilities Engineering Command (NAVFAC) P-272, Part 4, and local maintenance facilities to validate compatibility. The following factors must be considered for performance of maintenance in existing facilities as well as for influence on potential new construction plans.

(a) Power Pack. To pull the power pack, the turret must be traversed to the left approximately 90°. Thus, the gun tube will extend beyond the hull approximately 12- to 13-feet, and the back to the turret will extend beyond the hull approximately 5-feet. In existing facilities, this may limit or preclude use of adjacent maintenance bays. Clearance to fixed/immovable objects must also be considered. A maintenance bay which is 32-feet by 32-feet will readily accommodate the M1A1 with the turret traversed left for power pack removal.

(b) Protective Armor Skirts. Protective armor skirts will require up to 7-feet 2-inches of space to be opened. This may require that tanks be "strategically spotted" in work bays. Armor skirts may be removed, if required, to eliminate clearance problems. Armor skirts must be appropriately safeguarded. A maintenance bay of 32-feet by 32-feet will permit the longest skirts on both the left and right sides of the tank to be opened simultaneously, provided the tank is centered in the bay.

(c) Exhaust Ventilation. Exhaust volume and temperature for the M1A1's turbine engine are greater than that for the M60A1 R/P diesel. The M1A1 may emit up to 15,000 ft(3) of air per minute at 930° F when operating at maximum power. Most engine operations in the maintenance shop, however, will be at idle with discharges of approximately 2,700 ft(3) per minute at temperatures up to 480° F. The power pack may be operated in the shop either in the tank or in a "ground-hopped" configuration, provided that appropriate measures are taken for ventilation of exhaust gases.

(d) Turret. Some maintenance procedures require the turret to be pulled at the fourth and fifth echelons of

ENCLOSURE (1)

maintenance. Turret weight for the M1A1 is approximately 48,000 pounds.

(3) Housing and Community. Although the transition to the M1A1 involves some manpower reductions, changes in troop housing and dining facilities are not warranted.

(4) Utilities and Ground Improvement

(a) Electrical Distribution Lines. Power will be required for the U-COFT/M-COFT and for perimeter/security lighting in M1A1 tank parks. NAVFAC P-80, CNN 812-30 provides general guidelines for electrical distribution planning.

(b) Perimeter/Security Lighting. NAVFAC P-80, CNN 812-40 requires the conduct of an engineering survey to determine illumination, intensity, number, and location of lights.

(c) Ground Fencing. As with perimeter/security lighting, fencing provides a complementary means of augmenting security of M1A1 tank parks. NAVFAC P-80, CNN 872-15 provides design criteria for perimeter fencing, to include height, type of fencing, and distances from objects to be secured.

(d) Parking. The overlap between the M60A1 R/P and the M1A1 will cause a temporary imbalance in parking space requirements. Criteria for ground unit parking areas is found in NAVFAC P-80, CNN 852-10.

(e) Gunnery Ranges. Range requirements for annual gunnery training require reexamination by each Marine Corps Base in light of the operational characteristics and capabilities of the M1A1. The M1A1 can travel faster while engaging both stationary and moving targets at greater ranges and with greater accuracy. The ballistic characteristics of 120 mm ammunition may alter existing range restrictions. FM 17-12-1 contains gunnery range requirements for the M1A1. It should be noted that laser certification of ranges is required to effectively range using the laser rangefinder.

(5) U-COFT

(a) Introduction. The contractor will prepare individual systems for shipment and delivery, and will install all systems at the designated sites. The facilities requirements contained herein are to be satisfied by incorporation into a site, either by modification of an existing site or design of a new site. All resulting designs and preparation work by the Marine Corps shall be performed to all current applicable codes. Site preparation, excluding the U-COFT systems with pads provided

ENCLOSURE (1)

by the contractor, is the responsibility of the gaining command. The contractor will install one concrete pad per U-COFT.

(b) Civil

1 Access Roads. U-COFT systems will be delivered to each site on 18-wheel tractor-trailer (flatbed) vehicles with overall dimensions of 8-feet 6-inches wide by 13-feet 6-inches high by 65-feet 0-inches overall length. Total maximum loads for each axle shall be:

<u>Axle</u>	<u>Load</u>
Tractor Steering Axle Load	12,000 lbs
Tractor Rear Tandem Axle Load	34,000 lbs
Semitrailer Rear Tandem Axle Load (Total)	34,000 lbs

The tractor with a 42-foot flatbed trailer requires a minimum turning radius of 50-feet. All roadways and service roads of the base required for access to each site shall be capable of allowing passage of the tractor-trailer and loads described above in all types of weather conditions. Removal or temporary relocation of all vertical obstructions is the responsibility of the Marine Corps. If the site is located on a dead-end road, a turnaround area for the tractor-trailer shall be provided as follows:

<u>Type Turnaround</u>	<u>Size</u>
180o Turnaround	120-feet by 120-feet
Back Up Into a Lane Turnaround	Lane: 12-feet by 75-feet Corner Radius: 50-feet

2 Unloading Area. The gaining command shall provide an unloading area contiguous to the front side of each U-COFT system. It shall be at least 12-feet wide and 110-feet long and subject to the aforementioned turnaround conditions. U-COFT shelters will be unloaded directly from the trailer and placed at their final locations on the U-COFT system pads. A contractor furnished, mobile-type 30-ton crane will be utilized for unloading the shelters.

3 Access to Supporting Facilities. Determination of supporting facilities for U-COFT, such as toilets, water fountains, parking areas, vending machine areas, and janitorial storage areas, is the responsibility of the gaining command.

ENCLOSURE (1)

a During U-COFT installation, the contractor will require the following support from the Marine Corps:

(1) Access to water.

(2) 120/208 V, 60 amp electrical power supply within 500-feet of each site.

(3) Temporary base access permits for contractor or subcontractor personnel and vehicles.

b During training operations:

(1) Access to water.

(2) Access by FSR's to toilets, drinking fountains, and dining facilities.

(3) Permanent access permits for FSR's.

(4) Access permits for subcontractor personnel.

(5) Access to U-COFT systems for FSR's maintenance van.

(6) Parking area (overnight) for FSR's maintenance van.

(c) Architectural. The gaining command shall be responsible for selecting a site for installation of U-COFT and shall determine if single or multiple systems will be located at each site. Using Government criteria, the contractor has determined the optimum arrangement of a single U-COFT system. Multiple U-COFT systems could be arranged in a number of site plans. Accordingly, it is recommended that a site plan philosophy be adopted that logically allows placement of additional systems at one site, as described below. A single U-COFT system, as shown in figure 12, utilizes a cleared site area which shall be 32-feet x 40-feet, minimum. The U-COFT system will be placed in the center of the cleared area. Multiple systems shall be added by placing single U-COFT system cleared areas, figure 13, adjacent to one another as shown in figure 14. The U-COFT pad shall consist of a wire-mesh, reinforced, 33-feet 6-inches x 24-feet 8-inches x 0-feet 6-inches (nominal thickness) concrete pad capable of withstanding the loads/weights of the U-COFT system and pedestrian traffic. A roadway which is a minimum 12-feet wide shall be located at the front of single or multiple U-COFT systems, as shown in figure 14. Site orientation is not an important factor for

ENCLOSURE (1)

consideration of solar heat gains unless located in the shade of trees, hills/mountains, structures, or buildings which reduce solar heat gains.

1 Location. The location of single or multiple U-COFT sites shall be selected by the gaining command. The following shall be considered when selecting a site:

a U-COFT systems shall not be located under overhead utilities or electrical power lines.

b U-COFT systems shall not be located at sites which equal or exceed radio frequency radiation limits prescribed herein.

c Sites shall be well drained.

d Sites shall not have a grade slope over two percent.

e The site(s) shall be located a safe distance (minimum of 50-feet) from any hazardous/flammable materials or operations, such as fuel storage, ammo dumps, radar, and firing ranges, as determined by the Base Safety Officer.

f Sites shall be clear of all obstacles or obstructions. Underground utilities or other obstacles must be a minimum of 2-feet below grade. Any underground utilities or other obstacles between 2-feet and 3-feet below grade must be identified and properly marked at ground level.

2 Physical Arrangement and Orientation. The layout of the shelters for the U-COFT system is provided in figure 15. A listing of the sheltered system equipment and characteristics is provided in appendix U. The sheltered layout was developed with the prime objective of achieving an arrangement of the shelters which would optimize the use of space for each site.

3 Landscaping/Drainage/Slope Requirement. The gaining command will provide a level site with well drained soil which has been stripped of sod and all organic material and provide all drainage structures, access roads, and utilities external to the site. Sites with well drained soil shall be as follows:

a The site shall be adequately drained to prevent water flowing into, or ponding on, the site. When site conditions require, ditches, swales, or underground drains shall be provided by the gaining command to intercept surface water and

conduct the surface water from the site.

b The slabs shall be constructed on soils which readily drain. Generally, the following soil types are readily drained:

(1) Well grounded gravels, gravel-sand mixtures, little or no fines.

(2) Poorly graded gravels or gravel-sand mixtures, little or no fines.

(3) Well graded sands, gravelly sands, little or no fines.

c Any soil that has a percolation rate of more than 15 minutes per inch will not meet the "well drained" criteria.

The percolation rate shall be determined in accordance with the following procedure:

(1) Dig or bore a hole not less than 4-inches in diameter or more than 12-inches in diameter and 36-inches deep.

(2) The bottom and sides of the hole shall be carefully scratched to remove any smeared soil surfaces. All loose material shall be removed from the hole and 2-inches of fine gravel added to prevent scouring.

(3) The hole shall be carefully filled with clear water to a depth of 12-inches.

(4) After maintaining the water level at the 12-inches depth for 15 minutes by adding water as required, measure the time for the water level to drop 3-inches.

(5) If more than 45 minutes is required for the water level to drop 3-inches, the soil does not meet the "well drained" criteria.

d All roots, vegetation, and other organic or unsuitable materials shall be removed to a depth of 16-inches below the top of the original ground surface. The material removed shall be replaced by compacted, well drained soil capable of supporting 2,500 pounds per fty. The contractor shall dress

71

and restore the site after the installation of the U-COFT system(s) to its condition prior to the contractor's arrival.

4 Site Information. Each gaining command shall provide a site planning packet which will provide adequate information for the contractor to transport and install the U-COFT system(s). The packet will be furnished to the contractor via the Commandant of the Marine Corps (CMC) (LF). The contractor will conduct a site survey visit not later than 15 months prior to start of installation. CMC (LF) will coordinate all site surveys. Additional information may be required as a result of the site survey. Such information, if required, will be provided within 30 days of the request. The contractor will notify the Marine Corps within 30 days of receipt of any information that presents unsatisfactory conditions. Installation will commence approximately 38 weeks prior to the ready-for-training date. At a minimum, the following information or documents shall be included:

- a Map of base on which site is located.
- b Utility plans showing all overhead and underground utilities and telephone lines in the site area.
- c Site drainage plans.
- d Construction specifications and drawings of site preparation.
- e Results of Electromagnetic Interference (EMI) site survey, as required.
- f Maps showing locations and access to water/electrical power for construction to be done by the contractor.
- g Names, locations, and telephone numbers of base personnel involved in the transportation and installation of the U-COFT.
- h Tables showing average low and high temperatures, worst frost depth, humidity, rainfall, snowfall, wind direction, and wind speed on a monthly basis for a year.
- i Soil investigation reports, logs of hole borings, and soil compaction reports.
- j Procedure for contractor/subcontractor personnel and vehicles to gain access to the base.

ENCLOSURE (1)

k Base's list of approved general and electrical contractors for work on base.

l Site plans showing all existing or proposed contours, roads, sidewalks, boundaries, and the like.

m Load limits of on-base bridges and highways over which the system will travel to the site.

n Vertical clearances of all overhead utilities, bridges, and trees.

5 Working Clearances and Access. Figure 15 shows the interior layout for a single U-COFT system. The layout shows the clearance around each piece of equipment and the location and size of doors. Figures 12, 13, and 14 show exterior clearance dimensions. These spaces are the minimum required for access and working clearances for satisfactory performance of operational and maintenance functions.

6 Personnel Occupancy. The maximum number of personnel to be present in a single U-COFT system during normal operations is depicted below. If maintenance or repairs require a contractor FSR or subcontractor, it is anticipated that training will cease and students will leave the shelters.

<u>Shelter No.</u>	<u>Personnel</u>	<u>Type Personnel</u>
1	1	Contractor FSR (Normally sits in Shelter No. 3)
2	1	Instructor/Operator (Training)
	2	Students
	1	Instructor/Operator Debriefing/Debriefing)
	2	Students
3	2	Visiting Observers
Roaming at Large	<u>1</u>	Supervisor
TOTAL	10	

(d) Structural

1 Ground Loads. The native soil at sites selected shall have a minimum load-bearing capacity of 2,00 pounds per square foot. If the site has a grade slope of more than two percent, the gaining command is responsible for improving the area to be under the U-COFT system pads. The grade slope of each site shall not exceed two percent after improvement. If required to meet load-bearing capacity, the soil shall be compacted by the gaining command to the following standards:

ENCLOSURE (1)

<u>Method</u>	<u>Standard</u>
95 percent Modified Proctor Test	AASHO T-180, or ASTMD-1557
100 percent Standard Proctor Test	AASHO T-99, or ASTM D-698

2 Trenches/Penetrations. Trenches and penetrations required at each site are listed below. Additional penetrations required for installation of Government-installed systems or equipment shall be the responsibility of the gaining command.

a Trenches. Trenches (4-feet deep) required for underground electrical and telephone service.

b Penetrations. The following penetrations shall be done by the contractor:

(1) 10-feet long ground rods.

(2) Holes (6-feet deep maximum) for posts supporting the contractor-installed electrical service panel.

3 Special Handling Equipment. The contractor will provide all equipment required to remove U-COFT shelter units from the transporting trailers and install the units on the U-COFT system pads. All uplifting equipment will be capable of lifting 150 percent of the heaviest load. Mobile-type 30-ton cranes may be used as lifting equipment. The crane booms will extend to a vertical height of approximately 60-feet. All electrical lines which may interfere with the crane operation will be temporarily removed or relocated by the gaining command.

4 Equipment Mounting. The contractor will provide and install all shelter hold-down attachment devices on the shelter and embedded in the U-COFT system pad. All such devices will be designed and installed according to applicable Government installation codes. Details will be provided in the base drawing package at the time of installation.

(e) Mechanical

1 Air-Conditioning/Heating. There will be no air-conditioning/heating equipment requirements imposed on sites by the U-COFT system. The air-conditioning system for the shelters consists of packaged units that are a part of each shelter of a U-COFT system. The gaining command is responsible for providing electrical power to packaged Air-Conditioning Units (ACU's). The electrical power for ACU's and the balance of the

entire U-COFT system shall be provided by the gaining command to a single point site interface. The capacity and dispersement of ACU's are as listed below. Figure 15 shows ACU locations.

<u>Shelter No.</u>	<u>Installed ACUs per Shelter</u>	<u>Total ACU Capacity per Shelter (ACU tons & Btu/hr)</u>	<u>Heating Capacity</u>
1	3	9 tons or 108,000 Btu/hr	24.6 KW
2	1	3 tons or 36,000 Btu/hr	8.2 KW
3	1	3 tons or 36,000 Btu/hr	8.2 KW

2 Physical Security Features. It is the responsibility of the gaining command to provide security fencing and intruder detection, if required. The gaining command shall provide lighting (five foot candles average minimum) adequate for personnel to safely gain access to the shelters on a moonless night.

(f) Electrical

1 Electrical Services Required--Type and Characteristics for 60-Hz Sites. The U-COFT system has been designed to operate from a secondary electrical power source with the basic characteristics and steady-state requirements listed below. The input voltage, when filtered by General Electric supplied equipment (removes 99 percent of random noise and 99 percent of 60-Hz harmonics), shall meet the stated steady-state requirements.

Voltage to Transformer 480 VAC
Frequency 60 Hz \pm 10 percent
Phase 3-Phase--Delta Connected
Number of Wires 4 Wires (4th wire for safety ground)

Voltage to EDC 208/120 VAC \pm 10 percent
Phase 3-Phase--Wye Connected
Number of Wires 5 Wires (5th wire for safety ground)

2 Power Interruptions and Transients. The following nonsimultaneous conditions of the trainer's power source shall not cause failure of any part or prevent resumption of normal service when the conditions have ceased:

a Any interruption of power that will be restored within 16 milliseconds to 30 seconds, occurring not more than once every 5 minutes.

b A voltage transient will not exceed 3.5 times normal voltage to one-tenth (0.1) of normal voltage except for short durations (less than one cycle).

ENCLOSURE (1)

c A frequency variation of plus or minus 15 percent for periods up to 10 seconds, no more than once every five minutes.

3 Simulator System Equipment Loads. Presented in table 7 is a summary of the electrical equipment loads for the U-COFT system. Presented in table 8 is a summary of the utility equipment loads for the U-COFT system.

Table 7.--U-COFT 60-Hz System Electronic Equipment Load.

<u>Item</u>	<u>Description</u>	<u>Load (KVA)</u>
1	Image Generator	11.41
2	VAX 11/780/Expansion Cabinet	3.89
3	Disk Unit	0.77

	Electronic Equipment Load SUBTOTAL	20.14
	Required Design Reserve	4.02
	Electrical Equipment Load TOTAL	24.16

*Test equipment reserve is an average load.

Table 8.--U-COFT 60-HZ System Utility Equipment Load.

<u>Item</u>	<u>Description</u>	<u>Load (KVA)</u>
1	ACU System (Worst Case Condition: 5 ACUs)	61.90
2	Lights	2.38
3	Work Bench	1.25
4	Maintenance Equipment	0.89
	Utility Equipment Electrical Load SUBTOTAL	66.42
	Required Design Reserve	13.26
	Utility Equipment Electrical Load TOTAL	79.68

4 Service Distribution Requirement. Figure 16 is a single-line electrical diagram showing the distribution of electrical services from the site source to the U-COFT equipment for 60-Hz sites. The source from the electrical service to the U-COFT system will be derived from a contractor provided transformer, as shown in figure 16. The Marine Corps will provide electrical services (480 V primary power) to the transformer location. The transformer shall be dedicated for use by the U-COFT equipment and shall have a 3-phase delta primary with a secondary of 208/120 VAC, 3-phase, 4-wire-wye. The transformer shall be provided with an electrostatic shield between the primary and secondary windings to reduce interwiring capacitance, thus increasing isolation from transients on the

primary. The power rating of the contractor furnished isolation transformer is 112.5 KVA. The secondary service shall have a short circuit interrupting rating of 22,000 amps root-mean-square (RMS) symmetrical or less. The Marine Corps shall provide an accessible on/off switch, such as a fused quick-disconnect box, at the secondary side of the utility pole. Figure 17 shows an electrical power diagram for the U-COFT site.

5 Initial Service Distribution--Provided by the Marine Corps. The gaining command shall leave 12-feet of excess feeder wires for termination by the contractor. The secondary electrical service from the contractor installed transformer shall be extended to the location of the site Electrical Distribution Center (EDC) (figures 12, 13, and 17).

6 Interface Definition. This paragraph defines the interface for the electrical distribution system for the contractor provided electrical distribution center and the Marine Corps provided electrical service feeder. The contractor shall provide the electrical distribution center interface requirements which are defined in figures 16, 17, and 18. The Marine Corps provided electrical service feeder is also defined on the referenced figures. U-COFT 60-Hz electrical layouts for single-system and multi-system sites are displayed at figures 19 and 20 respectively.

a Site Electrical Service Interface

(1) Physical. As part of the site preparation, the gaining command will provide electrical service to a location shown on figures 15, 16, and 17. The gaining command will leave 12-feet of excess feeder wires for termination by the contractor. The service shall be: 480 VAC, 60-Hz, 3-phase delta, 3 power wires plus separate safety ground wire.

(2) Functional. The contractor shall connect the Marine Corps-provided 480 V primary power to a contractor-furnished isolation transformer. This will in turn be connected to a contractor provided electrical distribution center. The U-COFT system will be plugged into the electrical distribution center.

b Site Telephone Service Interface

(1) Physical. As part of the site preparation, the gaining command will provide a telephone service in conduit located as shown in figures 16 and 18. The gaining command will leave 10-feet of excess wire in the conduit for termination at the time the contractor installs the distribution center. The service shall be one line of Class "C" (into the

ENCLOSURE (1)

local existing base network) and one line of Class "A" (into the local commercial telephone company capable of transmitting 1,200 baud) military service.

(2) Functional. The Marine Corps provided telephone service shall be connected to a contractor provided distribution center assembly (figures 16, 17, and 18). The U-COFT system will be plugged into the telephone receptacle, a part of the electrical distribution center.

7 Grounding. The contractor will provide and install the secondary grounding at each site as specified in Military Specification MIL-T-23991 for contractor installed equipment.

8 Lighting. There will be no exterior lighting installed by the contractor or as part of the U-COFT system. The site at which the shelters and equipment will be located shall have area lighting with a minimum average level of five footcandles to be provided by the gaining command.

9 Electromagnetic Interference. The gaining command will conduct an EMI survey as required at each U-COFT site and provide the results to the contractor during the site survey visit. To ensure proper operation of U-COFT equipment, the field intensity at each U-COFT site should be less than the values shown below.

<u>Frequency</u>	<u>E-Field (Volts/Meter)</u>
14 kHz to 2 MHz	1
2 MHz to 30 MHz	10
30 MHz to 2,000 MHz	5
2 GHz to 10 GHz	5
Above 10 GHz	20

10 Lightning Protection. The contractor will provide and install a lightning protection system at each site for the contractor installed equipment.

(g) Safety. The contractor will meet all base safety requirements applicable at the installation site.

(6) M-COFT

(a) Introduction. The Marine Corps Reserve Training Centers (MCRTC's) of the East and West Coast Reserve companies will each develop an M-COFT site. The contractor will install concrete pads for each trailer-mounted M-COFT. Additionally, he

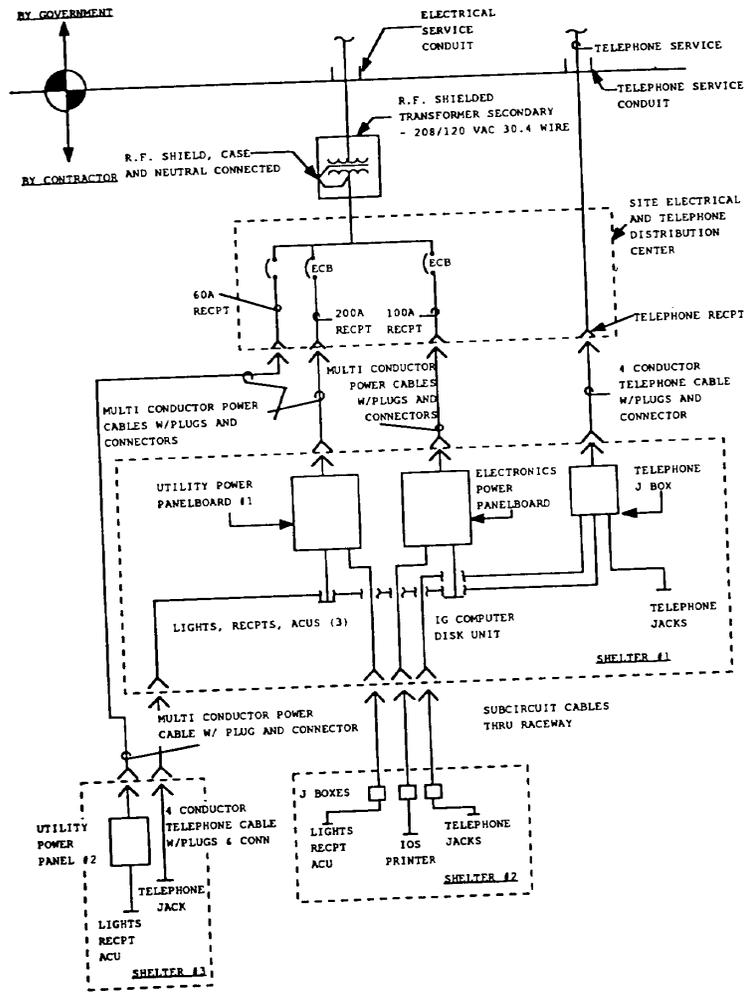

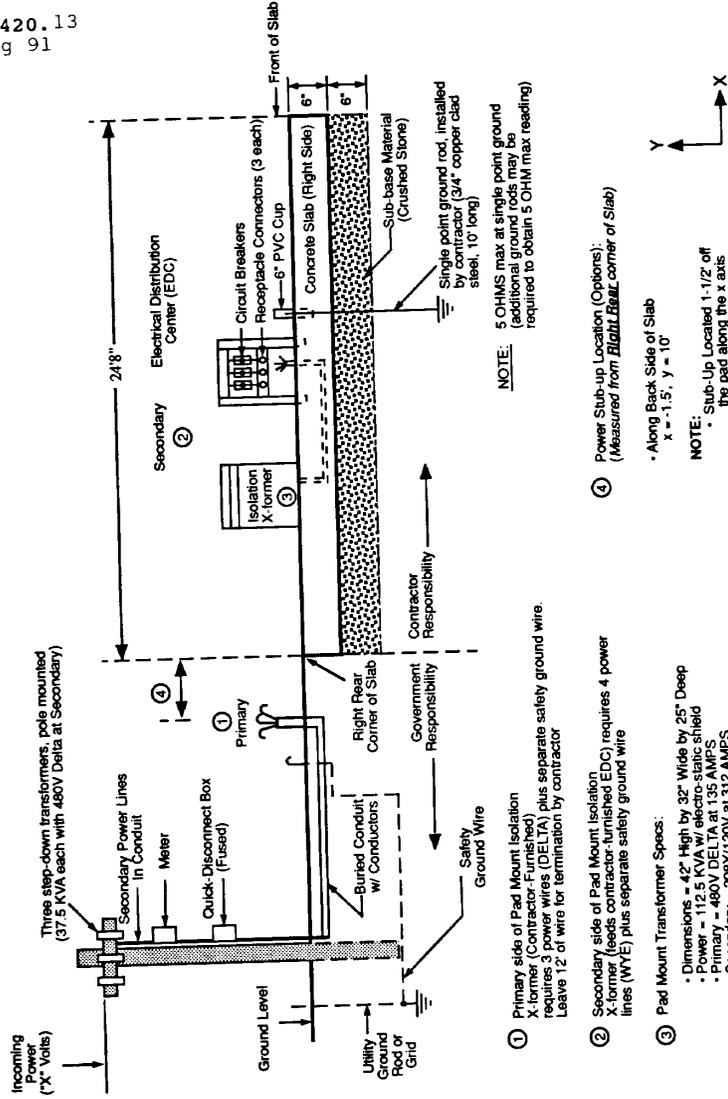

Figure 16.--U-COFT Electrical One-Line Diagram.

77

ELECTRICAL POWER DIAGRAM, U-COFT SITE

- ① Primary side of Pad Mount Isolation X-former (Contractor-Furnished) requires 3 power wires (DELTA) plus separate safety ground wire. Leave 12' of wire for termination by contractor.
- ② Secondary side of Pad Mount Isolation X-former (leads contractor-turnished EDC) requires 4 power lines (WYE) plus separate safety ground wire.
- ③ Pad Mount Transformer Specs:
 - Dimensions - 42" High by 32" Wide by 25" Deep
 - Power - 112.5 KVA w/ electro-static shield
 - Primary - 480V DELTA at 135 AMPS
 - Secondary - 208Y/120V at 312 AMPS

- ④ Power Stub-up Location (Options):
 - Along Back Side of Slab
 - X = 1.5', Y = 10'

NOTE: All Terminations to Isolation X-former and EDC done by Contractor

NOTE: 5 OHMS max at single point ground (additional ground rods may be required to obtain 5 OHMS max. reading)

NOTE: Single point ground rod, installed by contractor (3/4" copper clad steel, 10' long)

NOTE: Sub-Stub Located 1-1/2' off the pad along the x axis

ENCLOSURE (1)

80

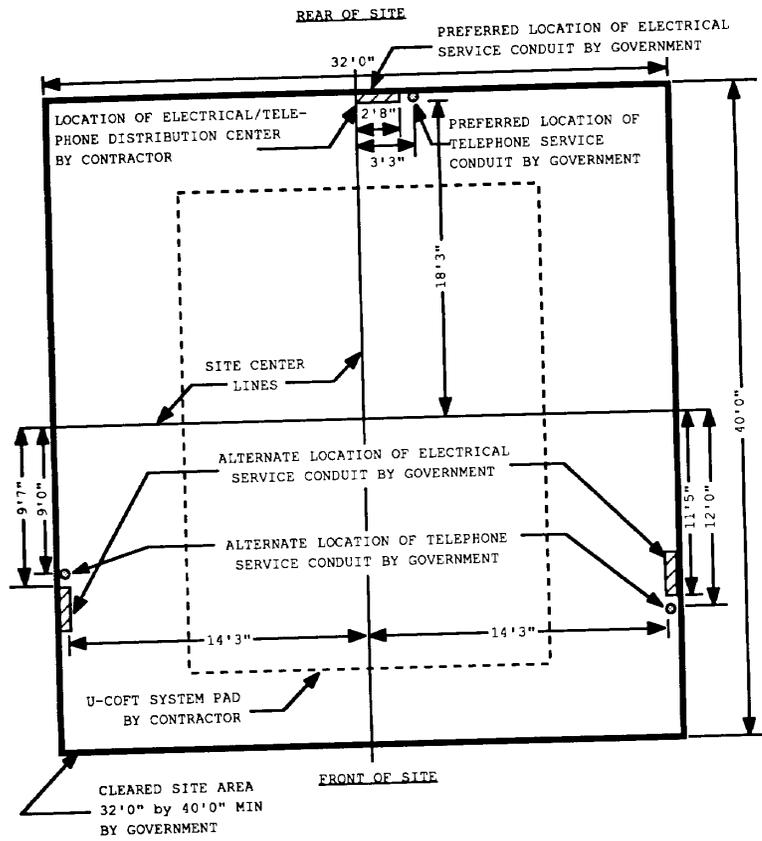

Figure 20.--U-COFT 60-Hz Electrical Multi-System Site Layout.

will prepare individual systems for shipment, will provide first destination delivery, and will install all systems at designated sites. Facilities requirements contained herein are to be satisfied by incorporation into a site, either by modification of an existing site or design of a new site. All designs and preparation work by the Marine Corps Reserve shall be performed to all current applicable codes. Site preparation, excluding the M-COFT systems with pads and electrical distribution centers provided by the contractor, are the responsibility of the gaining command. The M-COFT may be towed by any suitable fifth-wheel tractor, military or commercial, but the gaining command is responsible for all second and subsequent destination transportation.

(b) Civil

1 Access Roads. M-COFT systems will be installed in and delivered to each site on 18-wheel tractor-trailer (flatbed) vehicles with overall dimensions of 8-feet wide by 13-feet 6-inches high by 66-feet 0-inches overall length. Total maximum loads for each axle are:

<u>Axle</u>	<u>Load</u>
Tractor Steering Axle Load	12,000 lbs
Tractor Rear Tandem Axle Load	25,000 lbs
Semitrailer Rear Tandem Axle Load (Total)	25,000 lbs
Landing Gear Load	20,000 lbs

The tractor with a 45-foot flatbed trailer requires a minimum turning radius of 50-feet. All roadways and service roads of the MCRTC required for access to each site location shall be capable of allowing passage of the truck trailer and loads described above in all types of weather conditions. Removal/temporary relocation of all vertical obstructions is the responsibility of the Marine Corps. If the site is located on a dead-end road, a turnaround area for the tractor-trailer shall be provided as follows:

<u>Type Turnaround</u>	<u>Size</u>
180o Turnaround	120-feet by 120-feet
Back Up Into a Lane Turnaround	Lane: 12-feet by 85-feet Corner Radius: 60-feet

2 Access to Supporting Facilities. Determination of supporting facilities for M-COFT, such as toilets, water fountains, parking areas, vending machine areas, and janitorial storage areas, is the responsibility of the gaining command.

a During M-COFT installation, the contractor will require the following support from the Marine Corps:

(1) Access to water.

(2) 120/208 V, 60 amp electrical power supply within 500-feet of each site.

(3) Temporary MCRTC access permits for contractor or subcontractor personnel and vehicles.

b During training operations:

(1) Access to water.

(2) Access by FSR's to toilets, drinking fountains, and dining facilities.

(3) Permanent access permits for FSR's.

(4) Access permits for subcontractor personnel.

(5) Access to M-COFT systems for FSR's maintenance van.

(6) Parking area (overnight) for FSR's maintenance van.

(7) Use of classroom.

(c) Architectural

1 M-COFT Trailer Site. The gaining command shall be responsible for selecting a site or sites for installation of M-COFT. Using Government criteria, the contractor has determined the optimum arrangement of a single M-COFT system. An M-COFT system, as shown in figure 21, utilizes a concrete pad which shall be 60-feet by 30-feet by 6-inches, minimum, if it is going to be located on grass, dirt, or some other unfinished surface. If it is located on blacktop or another finished area, the size of the concrete pad can be reduced to 48-feet by 14-feet by 6-inches. The limits of the site will remain unchanged if the smaller pad is used. The M-COFT system will be placed in the center of the pad. An access, maneuvering and egress area shall also be provided to accommodate the truck and trailer during installation of the M-COFT. A roadway with a minimum 12-foot width shall provide access to the M-COFT site. Site orientation is not an important factor for consideration of solar heat gains, unless located in the shade of trees, hills/mountains, structures, or buildings which reduce solar heat gains.

ENCLOSURE (1)

2 M-COFT Support Facilities. Each MCRTC will provide a work area within the MCRTC for the FSR repairers. The requirement is not for dedicated space and will apply only during the time the M-COFT is at the site. The following support will be provided to the FSR, as required, within the MCRTC:

- a One workbench 30-inches by 60-inches by 36-inches high.
- b One workbench light (with adjustable arms).
- c One lockable storage cabinet (36-inches by 18-inches by 72-inches high).
- d One wastebasket.
- e One chair/stool for workbench.
- f Telephone (extension to M-COFT system).
- g Three 120 V, 20-amp duplex receptacles adjacent to workbench.

3 Instructional Support Facilities. During training operations, each MCRTC will provide a classroom (14-feet by 20-feet minimum) which will accommodate at least eight students, two visitors, and an instructor. The classroom will be equipped with:

- a Ten chair desks, or chairs and tables.
- b Blackboard.
- c Magnetic/White board.
- d Projection screen.
- e Vu-graph projector.
- f 35 mm slide projector.
- g Lectern.

4 Location. The location of single or multiple M-COFT sites shall be selected by the gaining command. The following shall be considered when selecting a site:

- a M-COFT systems shall not be located under overhead utilities or electrical power lines.

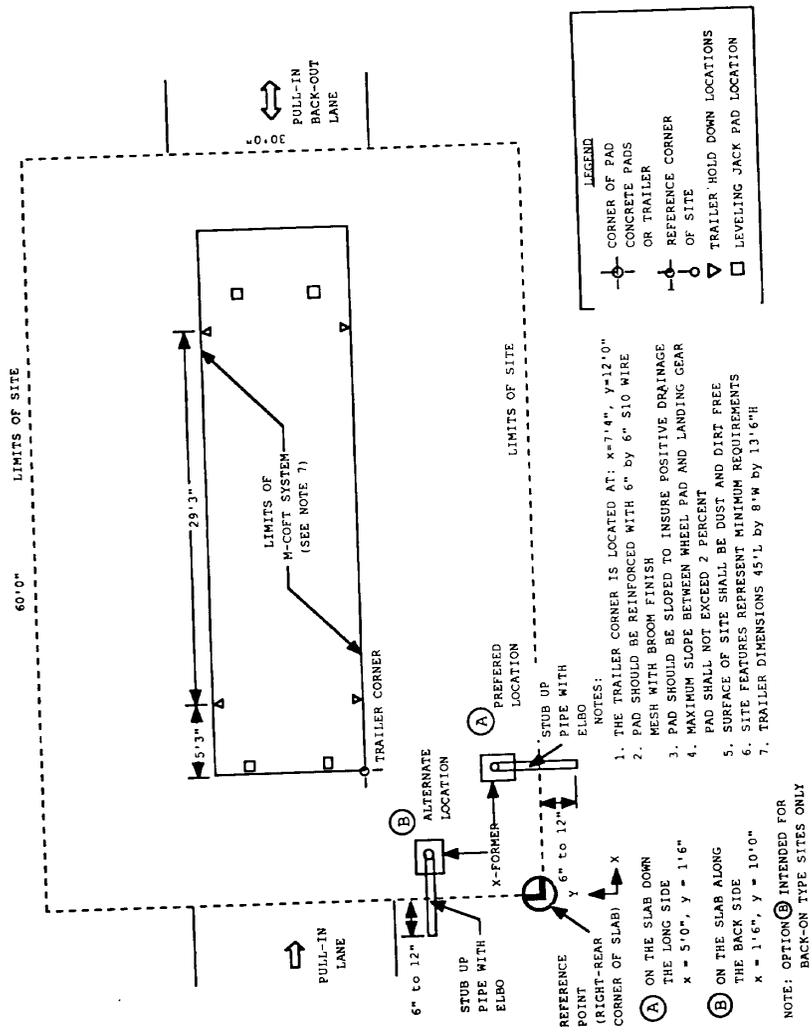

Figure 21.--M-COFT Single System Site Layout.

b M-COFT systems shall not be located at sites which equal or exceed radio frequency radiation limits prescribed herein.

c Sites shall be well drained.

d Sites shall not have a grade slope which exceeds two percent.

e The site(s) shall be located a safe distance (minimum of 50-feet) from any hazardous materials or operations, such as fuel storage, ammo dumps, radar, and firing ranges, as determined by the I-I Safety Officer.

f Sites shall be cleared of all obstacles or obstructions. Underground utilities or other obstacles must be a minimum of 2-feet below grade. Any utilities or other obstacles between 2-feet and 3-feet below grade must be identified and properly marked at ground level.

5 Physical Arrangement and Orientation. The layout of the shelters for the M-COFT system is provided in figure 9. A listing of the sheltered system equipment and characteristics is provided in appendix U. The layout considered: equipment configuration and functional groupings; operator and maintenance personnel activities; power, signal and grounding cabling and system constraints; and movement and use of maintenance equipment. The layout represents the minimum space required to accommodate a single system.

6 Landscaping/Drainage/Slope Requirement. The gaining command will provide a site for each M-COFT with the dimensions detailed in figure 21. The finished grade shall not exceed a slope of two percent. The gaining command shall provide a level, well drained, dust/soil-free site which will support the wheels, stairs, leveling jack, and landing gear loads of the trailer without causing settlement or deformation of the site surface; and shall provide all drainage structures, access roads, and utilities external to the site.

7 Site Information. Each gaining command shall provide a site planning packet which will provide adequate information for the contractor to transport and install the M-COFT system(s). The packet will be furnished to the contractor via CMC (LF). The contractor will conduct a site survey visit not later than nine months prior to start of installation. CMC (LF) will coordinate all site surveys. Additional information may be required as a result of the site survey. If required, such information will be provided within 30 days of the request. The contractor will notify the Marine Corps within 30

ENCLOSURE (1)

days of receipt of any information that presents unsatisfactory conditions. Installation will commence approximately 20 weeks prior to the ready-for-training date. At a minimum, the following information or documents shall be included:

- a Map of installation on which site is located.
- b Utility plans showing all overhead and underground utilities and telephone lines in the site area.
- c Site drainage plans.
- d Construction specifications and drawings of site preparation.
- e Results of EMI site survey, as required.
- f Maps showing locations and access to water/electrical power for construction to be done by the contractor.
- g Names, locations, and telephone numbers of center personnel involved in the transportation and installation of the M-COFT.
- h Procedure for contractor/subcontractor personnel and vehicles to gain access to the center.
- i MCRTC list of approved general and electrical contractors for work on the center.
- j Site plans showing all existing or proposed contours, roads, sidewalks, boundaries, and other similar information.

8 Working Clearances and Access. Figure 9 shows the interior layout for an M-COFT system. The layout shows the clearance around each piece of equipment and the location and size of doors. Figure 21 shows exterior clearance dimensions. These spaces are the minimum required for access and working clearances for satisfactory performance of operational and maintenance functions.

9 Personnel Occupancy. The maximum number of personnel to be present in a single M-COFT system during normal operations is depicted below. If maintenance or repairs require a contractor FSR or subcontractor, it is anticipated that training will cease and students will leave the shelters.

ENCLOSURE (1)

<u>Shelter No.</u>	<u>Personnel</u>	<u>Type Personnel</u>
Computer	1	Contractor FSR
Trainer	1	Instructor/Operator (Training)
	2	Students
	2	Visiting Observers
Roaming at Large	1	Supervisor
TOTAL	7	

(d) Structural

1 Ground Loads. The site surface selected shall have a load bearing capacity sufficient to support wheels, stairs, landing gear, and leveling jack loads of a trailer without causing deformation of the site surface. The slope of each site shall not exceed more than two percent.

2 Trenches/Penetrations. Trenches and penetrations required at each site are listed below. Additional penetrations required for installation of Government-installed systems or equipment shall be the responsibility of the gaining command.

a Trenches. Trenches required for underground electrical and telephone service from the MCRTC-installed electrical service panel and/or transformer.

b Penetrations

(1) Ground rods (ten 30-foot long).

(2) Holes (3-foot deep nominal) for posts supporting the contractor-installed electrical service panel.

3 Special Handling Equipment. There will be no requirement for the Marine Corps to provide lifting or handling equipment.

4 Equipment Mounting. The contractor shall provide a tie-down system for the M-COFT trailer which shall consist of a ground anchor and a cable/strap/chain with a tensioning device. The tie-down system shall be designed and installed in accordance with applicable building codes. The ground anchors and cables/straps/chains will be required at four locations for each trailer. Holes through which the slings can be fastened are located on both sides of the trailer 65-inches from the rear edge and 124-inches from the front edge. All holes are 3-inches high and 2-inches wide (oblong), with the bottom located approximately 46-inches above the ground plane. The holes are 7/8-inch thick.

(e) Mechanical

1 Air-Conditioning/Heating. There will be no air-conditioning/heating equipment requirements imposed on sites by the M-COFT system. The air-conditioning system for the shelters consists of packaged units that are a part of each shelter of an M-COFT system. The gaining command is responsible for providing electrical power to packaged ACU's. The electrical power for ACUs and the balance of entire M-COFT system shall be provided by the gaining command to a single electrical distribution center. The capacity and dispersement of ACUs are as listed below. ACU locations are shown in figure 9.

<u>Shelter</u>	<u>Installed ACUs per Shelter</u>	<u>Total ACU Capacity per Shelter (ACU tons & Btu/Hr)</u>	<u>Heating Capacity</u>
Computer	3	9 tons or 108,000 Btu/hr	24.6 KW
Trainer	1	3 tons or 36,000 Btu/hr	8.2 KW

2 Physical Security Features. It is the responsibility of the gaining command to provide security fencing and intruder detection, if required. The gaining command shall provide lighting (five footcandles average minimum) adequate for personnel to safely gain access to the shelters on a moonless night.

(f) Electrical

1 Electrical Services Required--Type and Characteristics for 60-Hz Sites. The M-COFT system has been designed to operate from a secondary electrical power source with the basic characteristics and steady-state requirements listed below. The input voltage, when filtered by General Electric supplied equipment (removes 99 percent of random noise and 99 percent of 60-Hz harmonics), shall meet the stated steady-state requirements.

Voltage to Transformer	480 VAC
Frequency	60 Hz + 10 percent
Phase	3-Phase--Delta Connected
Number of Wires	4 Wires (4th wire for safety ground)
Voltage to EDC	208/120 VAC + 10 percent
Phase	3-Phase--Wye Connected
Number of Wires	5 Wires (5th wire for safety ground)

2 Power Interruptions and Transients. The following nonsimultaneous conditions of the trainer's power

ENCLOSURE (1)

source shall not cause failure of any part or prevent resumption of normal service when the conditions have ceased:

a Any interruption of power that will be restored within 16 milliseconds to 30 seconds, occurring not more than once every five minutes.

b A voltage transient will not exceed 3.5 times normal voltage to one-tenth (0.1) of normal voltage, except for short durations (less than one cycle).

c A frequency variation of plus or minus 15 percent for periods up to 10 seconds, occurring no more than once every five minutes.

3 Simulator System Equipment Loads.

Presented in table 9 is a summary of the electrical equipment loads for the M-COFT system. Presented in table 10 is a summary of the utility equipment loads for the M-COFT system.

Table 9.--M-COFT 60-Hz System Electronic Equipment Load.

<u>Item</u>	<u>Description</u>	<u>Load (KVA)</u>

	Required Design Reserve	13.32
	Utility Equipment Electrical Load	TOTAL 79.94

4 Service Distribution Requirement. Figure 22 is a single-line electrical diagram showing the distribution of electrical services from the site source to the M-COFT equipment for 60-Hz sites. The Marine Corps will provide electrical services (480 V primary power) to the transformer location. The source from the electrical service to the M-COFT system will be derived from a contractor furnished transformer, as shown in figures 22 and 23. The transformer shall be dedicated for use by the M-COFT equipment and shall have a 3-phase delta primary with a secondary of 208/120 VAC, 3-phase, 4-wire-wye. The power rating of the contractor furnished transformer is 112.5 KVA. The transformer shall be provided with an electrostatic shield between the primary and secondary windings to reduce interwiring capacitance, thus increasing isolation from transients on the primary. The secondary service shall have a short circuit interrupting rating of 22,000 amps RMS symmetrical or less. The Marine Corps shall provide an accessible on/off switch, such as a fused quick-disconnect box, at the secondary side of the utility pole. Figure 23 is an electrical power diagram for the M-COFT site.

5 Initial Service Distribution--Provided by the Marine Corps. The gaining command shall leave 12-feet of excess feeder wires for termination by the contractor. The secondary electrical service from the contractor provided transformer shall be extended to the location of the site electrical distribution center (figure 9).

6 Interface Definition. This paragraph defines the interface for the electrical distribution system for the contractor provided electrical distribution center and the Marine Corps provided electrical service feeder. The contractor shall provide the electrical distribution center interface requirements which are defined in figures 22, 23, and 24. The Marine Corps provided electrical service feeder is also defined on the referenced figures.

a Site Electrical Service Interface

(1) Physical. As part of the site preparation, the gaining command will provide electrical service to a location shown on figure 21. The gaining command will leave 12-feet of excess feeder wires for termination by the contractor. The service shall be: 480 VAC, 60-Hz, 3 phase delta, 3 power wires plus separate safety ground wire. Figures 25 and 26 show detail plans of conduits and the electrical distribution center elevation.

ENCLOSURE (1)

MCO 8420.13
20 Aug 91

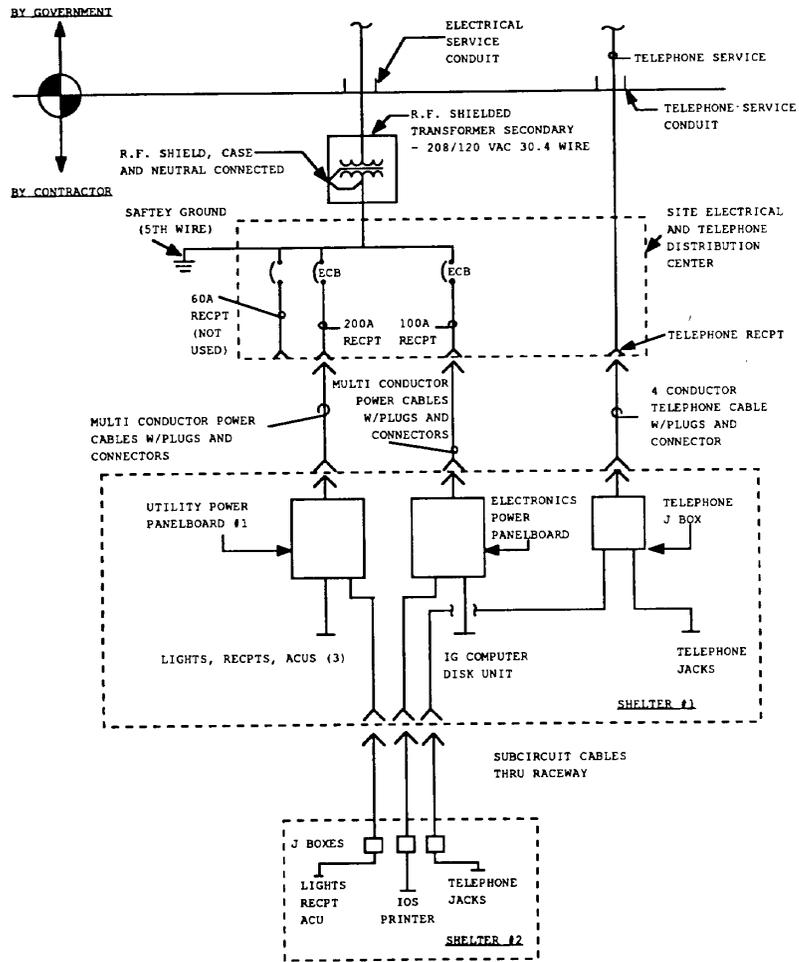

Figure 22.--M-COFT Electrical One-Line Diagram.

ENCLOSURE (1)

(2) Functional. The contractor shall connect the Marine Corps provided electrical service to a contractor-provided electrical distribution center assembly. The M-COFT system will be plugged into the electrical distribution center.

b Site Telephone Service Interface

(1) Physical. As part of the site preparation, the gaining command will provide a telephone service in conduit located as shown in figures 22 and 24. The gaining command will leave 10-feet of excess wire in the conduit for termination at the time the contractor installs the distribution center. The service shall be one direct private line to the local commercial telephone company capable of transmitting 1,200 baud and one extension line into the MCRTC.

(2) Functional. The Marine Corps provided telephone service shall be connected to a contractor provided distribution center assembly (figures 22 and 24). The M-COFT system will be plugged into the telephone receptacle, a part of the electrical distribution center.

7 Grounding. The gaining command will provide and install the necessary secondary grounding at each site as specified in Military Specification MIL-T-23991 for the contractor installed electrical distribution center.

8 Lighting. There will be no exterior lighting installed by the contractor or as part of the M-COFT system. The site at which the shelters and equipment will be located shall have area lighting with a minimum average level of five footcandles provided by the gaining command.

9 Electromagnetic Interference. The gaining command will conduct an EMI survey as required at each M-COFT site and provide the results to the contractor during the site survey visit. To ensure proper operation of M-COFT equipment, the field intensity at each M-COFT site should be less than the values shown below.

<u>Frequency</u>	<u>E-Field (Volts/Meter)</u>
14 kHz to 2 MHz	1
2 MHz to 30 MHz	10
30 MHz to 2,000 MHz	5
2 GHz to 10 GHz	5
Above 10 GHz	20

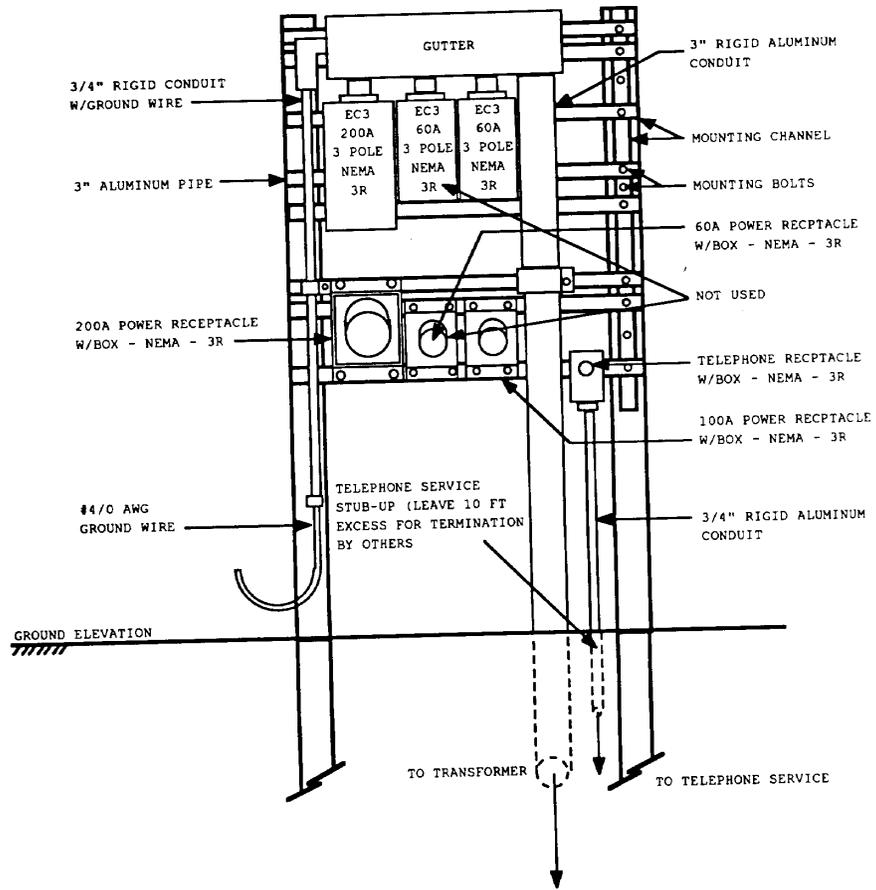

Figure 24.--M-COFT 60-Hz Electrical Distribution Center
Layout and Interface.

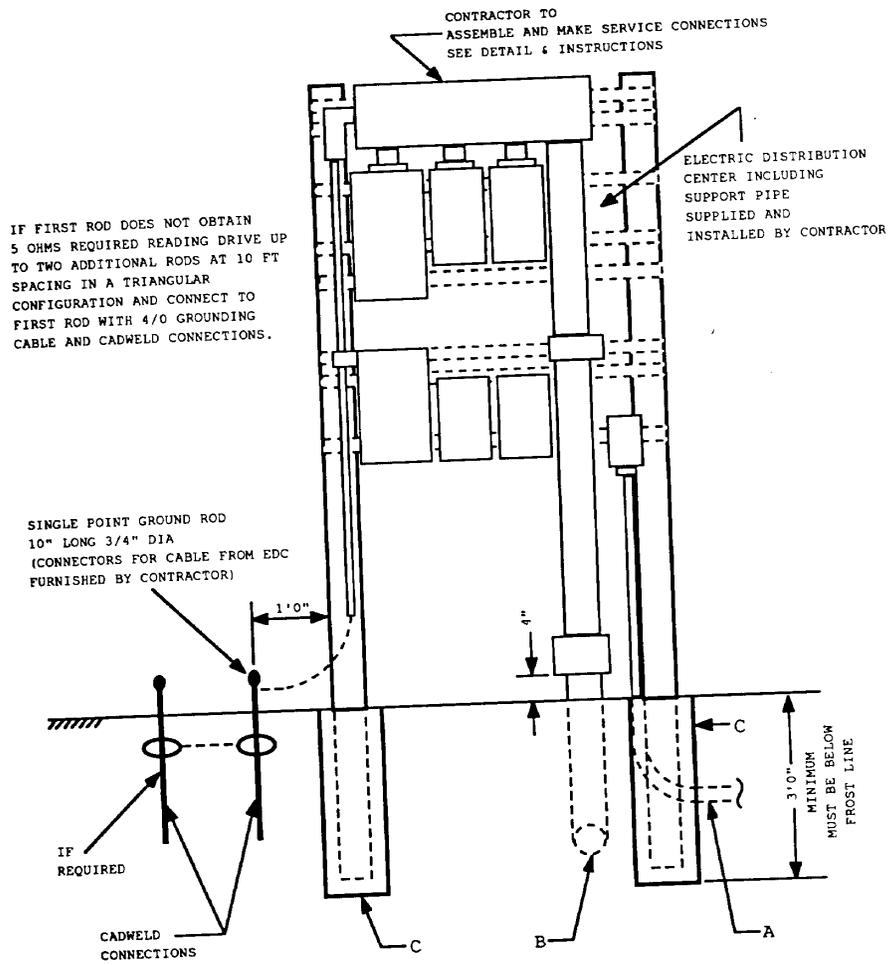

Figure 26.--M-COFT Electrical Distribution Center Elevation.

10 Lightning Protection. The gaining command will provide and install a lightning protection system at each site for the M-COFT and contractor installed electrical distribution center.

(g) Safety. The contractor will meet all center safety requirements applicable at the installation site.

(7) FSR Support

(a) The following support will be required at MCAGCC and during deprocessing at each site:

<u>Item</u>	<u>Qty</u>
Office (Site Supervisor)	1
Office (Technicians)	1
Desk, Secretarial	1
Desk, Double Pedestal	4
Chair, Secretarial	1
Chair, Swivel, w/Arms	4
Class "A" Phone (2 Lines)	2
Book Case, Military, Sectional	8
File Cabinet, 4-Drawer	1

(b) In addition to reprographic (copier) support, the following support will be required at both MCAGCC and Camp Lejeune during the post-fielding period:

<u>Item</u>	<u>Qty</u>
Office	1
Desk, Secretarial	1
Chair, Secretarial	1
Class "A" Phone (2 Lines)	1
Book Case, Military, Sectional	4
File Cabinet, 4-Drawer	1

(8) GDLs TPF Handoff/Inventory Representatives. The following support will be required for two GDLs Logistics Center representatives at each fielding location during the two weeks required for inventory/handoff:

<u>Item</u>	<u>Qty</u>
Office	1
Desk, Secretarial	1
Chair, Secretarial	2
Class "A" Phone	1

ENCLOSURE (1)

(9) Armory. Space demands for the storage of individual and crew-served weapons will change based on changes in the number personnel and vehicles per unit as well as a change in the number of crew-served weapons per tank. The overlap period between the M60A1 R/P and the M1A1 will create temporary imbalances in the storage requirements for crew-served weapons. The following listing identifies net changes in weapons and space allocation per NAVFAC P-80:

<u>Unit</u>	<u>Individual Weapons</u>	<u>Vehicle Rifles</u>	<u>Machinegun 7.62 mm</u>	<u>Machinegun .50 cal</u>
Tank Co	-25	-3	+11	-3
H&S Co, 2d TkBn	+12	3	+ 2	0
H&S Co, 3d TkBn	+20	0	+ 2	0

i. Packaging, Handling, Storage, and Transportation

(1) Packaging

(a) Processing for Shipment. The M1A1 Tank will be preserved in accordance with TM 38-450. Standard packaging of spare and repair parts is in accordance with MIL-STD-2073-1A.

(b) Deprocessing. The MFT's Deprocessing Team will perform all actions necessary to prepare tanks for issue at the site of each active gaining command. Those actions include providing data on the initial spares/repair parts package to load to SASSY, depreservation and preparation of tanks for inspection, initial technical inspection, correction of deficiencies, final technical inspection, inventory, and handoff to the receiving unit.

1 Deprocessing Team. As shown in table 11, the Deprocessing Team will be composed of a permanent core of personnel from ANAD, augmented by Marine Corps personnel from MCRDAC (CBGT), MCLB (Code 833-3), Albany, and the fielding location.

Table 11.--Deprocessing Team.

2 Support. In addition to providing augmentees, the following specific requirements are to be furnished at each fielding location:

a 1,500 fty of shop space with electrical, compressed air, and water access, as well as use of various maintenance equipment organic to installation maintenance units (i.e., borescope, pullover gauge, welding apparatus, and gun tube sling). The deprocessing site will have at least a 50-feet by 50-feet hardstand and a maintenance bay with minimum overhead lift capacity of 30 tons and a hook height of 27-feet. Secure holding space for tanks must be provided in the immediate vicinity of the deprocessing site. Additionally, secure storage must be provided for three general mechanic's tool sets, two turret mechanic's tool sets, and one STE-M1.

b Self-service supplies consumed by the MFT will be funded by the gaining command for active forces and by MCLB, Albany for MPS assets.

c Office space, including janitorial services, with one Class "A" and one Class "C" phone, to be furnished as follows:

<u>Item</u>	<u>Qty</u>
Desk, Secretarial	2
Chair, Secretarial	2

Copier	1

ENCLOSURE (1)

d Vehicular support (with operators) on an on-call basis, consisting of:

<u>Vehicle</u>	<u>Qty</u>
Blazer 4 by 4/HMMWV	1
5-Ton Truck	1
M88 Retriever	1
6000 lb RT Forklift	1

e One 8 yd(3) dumpster (to be emptied daily).

f Two AN/VRC 12 radios.

g On-call access to a steam cleaner.

h Road test track at least one mile in length.

3 Schedule. Appendix V contains the deprocessing schedule.

(2) Handling. Items of information pertaining to the M1A1 and portions of the tank itself are classified and require special handling. Accordingly, the Security Classification Guide at appendix W contains special instructions pertaining to the handling and safeguarding of the M1A1 data and hardware.

(a) Laser

1 The fire control system for the M1A1 incorporates a Laser Range Finder (LRF) which can cause permanent blindness to personnel not wearing laser safety goggles. The LRF should be treated as a direct fire weapon with a hazardous range of 8,000 meters. MCO P3570.1, "Policies and Procedures for Firing Ammunition for Training, Target Practice, and Combat," prescribes safety procedures to be followed in the use of laser devices.

2 All M1A1 operators, maintainers, and supervisory personnel are required to receive laser safety training commensurate with the hazard potential of the system. SPAWARINST 5100.12, "Navy Laser Radiation Hazards Prevention Program," provides requirements for the Department of the Navy laser radiation hazards prevention program. A school-trained Laser System Safety Officer is required for all bases where the M1A1 is operated. Requests for school quotas for course ST460 at the Naval Safety School, Bloomington, IN, will be forwarded via the chain of command to CG, MCCDC (TE33), Quantico, VA 22134-5000.

ENCLOSURE (1)

3 Only ranges which have been surveyed and certified in accordance with SPAWARINST 5100.12 may be lased with or without attenuation filters. Requests for formal laser range certification can be requested from SPAWARISYSCOM (OOF) via the chain of command and CMC (LPO). It is noted that effective training requires that all M1A1 training ranges be laser safety certified.

4 Safety information for the AN/UVG-3(M1) is as follows:

Nominal Ocular Hazard Distances:

Single pulse = 7 km (3.78 NM)
with 8-cm objective lens = 35 km (18.89 NM)
with 12-cm objective lens = 43.5 km* (23.47 NM)

Diffuse Reflection Hazard: None

Skin Hazard: None

Material Hazards: None

Eye Protection Required for Intrabeam Viewing:

Unaided OD = 4.0
Aided OD = 4.7

Recommended Protection Devices:

Unaided viewing - LGS - NDGA - Goggle or NDGA-7448-1
spectacles
Optically aided viewing - 4 mm thick KG-3 Filter

Assigned Buffer Zone: 5 mrad

Reference: Radiation Protection Special Study No.
25-42-0318-84, "Hazard Evaluation of the
Production Model M1 Tank Laser Rangefinder,"
17-20 July 1983.

* Information was not provided in the referenced report; therefore, it is calculated using the worst-case parameters provided in the report.

** An Eyesafe Laser Filter (ELF) has been installed into all rangefinders during production. ELF must be removed prior to actual combat operations.

ENCLOSURE (1)

20 Aug 91

(b) Radioactive Materials. The M1A1 contains the following radioactive materials:

1 Depleted Uranium

a Parts of the armor package and the M829A1 120 mm kinetic energy round contain DU. In both cases the DU is completely encased and direct body contact is prevented. Appendices W and X contain instructions on the safeguard and field expedient repair of DU armor. Appendix X also provides emergency procedures for peacetime accidents involving DU material.

b M1A1's with DU armor are identified by turret serial numbers having "U" for a suffix. The operator will know that his tank contains DU armor somewhere in the turret. No. operator or unit-level PMCS is required for DU armor. TB 9-1300-278 and TM-9-2350-200-BD contain specific instructions for evaluating, decontaminating, and repairing DU armor.

2 Tritium (H3). The M1A1 muzzle reference sensor contains 10 curies of tritium gas in a sealed module. This sensor poses no radiological concern to personnel unless the radioactive vial is damaged. Although most of the tritium dissipates into the air if the vial is broken, residual tritium contamination, in excess of peacetime limits, may remain on surfaces. TI 5101-15/2A contains specific handling guidance for tritium devices.

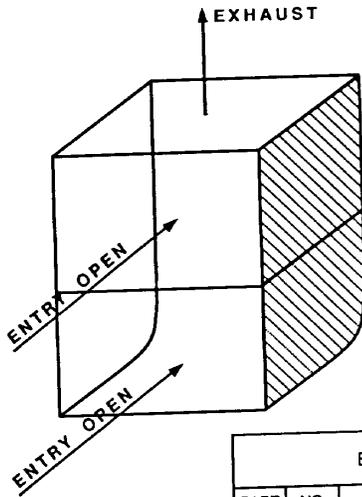

3 Thorium. The antireflective coating on M1A1 infrared optics contains thorium fluoride, which is radioactive. Internal body contamination by ingestion presents the only potential hazard of the material. Appropriate warning statements are included in M1A1 TM's.

(c) Exhausts. The M1A1 exhaust temperatures and volumes range from 480 oF and 2,700 ft(3)/min at idle to 930 oF and 15,000 ft(3)/min at maximum power. This presents a potential hazard to personnel/material in near proximity to the rear grille, particularly in "close quarters" which may be experienced in maintenance bays or aboard amphibious shipping. To alleviate such problems, exhaust deflectors may be locally fabricated using figures 27 through 31.

(d) Turret/Hull Separation. Certain maintenance procedures require that the turret be removed from the hull. ANAD will fabricate a turret stand for both 1st and 2d FSSG's. These turret stands will be force fed to 1st and 2d FSSG's.

ENCLOSURE (1)

M1A1 TANK EXHAUST DEFLECTOR

NOTES:

1. ALL WELDS $\frac{1}{4}$ FILLET UNLESS NOTED

ENCLOSURE (1)

(3) Storage. Special storage considerations for the M1A1 and components are addressed in appendix W. MPS assets will be stored under controlled humidity conditions and in accordance with TM 38-450.

(4) Transportation. The size and weight of the M1A1 present unique considerations in transportation planning. TM 55-2350-255-14, "Transportability Guidance, Tank, Combat, Full-Track M-1 Series" provides transportability guidance for logistical handling and movement of the M1A1. It also contains important safety measures for proper transport of the tank.

(a) Air. The M1A1 is transportable only by C-5A aircraft.

(b) Highway. Although the tracks of the M1A1 are rubber padded, movement over paved public highways should not be attempted without specific approval. When loaded aboard a suitable semi-trailer, the M1A1 can be transported over highways. Nonetheless, movement over public highways in the Continental United States (CONUS) and overseas should be made only when other transport modes cannot be used due to special permit considerations (length, width, weight) and bridge limitations. The Marine Corps will field 22 M1000 Transporters by September 1991. The M1000 is capable of transporting up to 80-ton loads and is equipped to transport the M1A1. In conjunction with the MK48/16 (modified), the M1000 has limited cross-country capability.

(c) Marine

1 Amphibious. Subject to deck and frame limitations, the M1A1 can be transported by most amphibious shipping (Landing Platform Dock (LPD), Landing Ship Dock (LSD), Landing Ship, Helicopter/Dock (LHD), and Landing Platform, Helicopter Assault (LHA)). Amphibious shipping limitations are based on expressed M1A1 weight data. It is assumed that parking will occur in storm seas and traversing, at worst case, will occur in Sea State 3.

	<u>Embarked Weight</u>	<u>Ship-To-Shore Combat Weight</u>

LSD 44-49	Well	Y/Y	Y/Y

- Y = Deck is certified structurally without restrictions.
 N = Deck is not certified structurally.
 R1 = Tank may traverse over the area at pierside or close to shore under calm seas only.
 R2 = Tanks may be positioned two abreast symmetrically about ship centerline. Tanks must be centered on frames 50, 60, 80, and 90.

a LHA Class, LHD Class, LPD 1-15 (with Shipalt LPD-916K), LSD 36 Class, and LSD 41 Class ships are structurally capable of transporting "parked" Landing Crafts Air Curshion (LCAS's), which have been preloaded with an M1A1, in all seas through Sea State 8. However, a preloaded LCAC transported aboard LPD 1-15 and the LSD 36 Class ships cannot be carried on docking blocks in the aftmost position. Preloaded LCAC's must be lashed in accordance with current Sea Ops Manuals.

b The aforementioned limitations are being incorporated into a "USMC Vehicle Characteristics and Shipboard Lashing Requirements" NAVSEA technical note to be issued in the fourth quarter, FY90. The LSD 28 Class is not addressed due to the inactivation schedule. The LST 1179 Class is not certified structurally to transport the M1A1.

ENCLOSURE (1)

2 Inland/Commercial. The M1A1 can be transported by a great variety of inland waterway cargo carriers and lighters (LCAC, LARC-LX, LCM-8, LCU-1466, LCU-1610, and BDL-MK I), and by seagoing cargo vessels. The tank, in its combat-ready condition, can be handled aboard U.S. flag merchant vessels, including Military Sealift Command (MSC) controlled ships, as follows:

a With its gun facing to the rear, on or below decks of any breakbulk ship with hatches at least 30-feet 8-inches long and 13-feet 0-inches wide, with clear headroom of at least 10-feet 0-inches and a minimum lift availability of 60 long tons.

b Aboard any Roll-On/Roll-Off (RO/RO) ship with a minimum clear headroom of 10-feet 0-inches and ramps at least 14-feet 0-inches wide with a capacity of 60 long tons.

c On any Lighter, Aboard Ship (LASH) or Sea Barge Carrier (SEABEE) which can be loaded and unloaded using shoreside cranes.

3 Dock, crane, boom, deck, and ramp capacities must be validated prior to commencement of any loading/unloading evolution.

(d) Rail. Movement of the M1A1 in CONUS and overseas will require special arrangements to confirm clearances. Rail movements entail suitable flatcars and will likely involve circuitous routing. Appendix W contains security procedures to be observed for rail movements.

(e) AVLB. The AVLB is approved for transit by the M1A1 but the following conditions must be observed until such time as an anticipated upgrade of the AVLB (to Class 70) is approved.

1 Maximum span length is 50-feet.

2 The M1A1 is centered on the bridge.

3 The maximum speed is 8 mph.

4 No starting, stopping, accelerating, or gear shifting on the AVLB.

5 Only one vehicle at a time is permitted on the bridge.

ENCLOSURE (1)

(f) M88A1 Recovery Vehicle. The M1A1 can be towed by the M88A1, provided the following provisions are strictly observed:

1 Personnel will not ride on or in an M1A1 while being towed.

2 On hard, level, smooth roads, tow at 5 mph or slower using a tow bar.

3 For cross-country, tow at 2 mph or slower using only tow cables.

4 Do not make sharp turns or sudden stops. Make gradual, wide turns in first gear.

5 The use of a second tank as a holdback vehicle is required even when using a tow bar. This will help prevent the heavier M1A1 from pushing the M88A1 to the side or jackknifing when stopping.

6 Safety precautions found in TM 9-2350-256-10, "Operator's Manual," and TM 20-22, "Vehicle Recovery Operations," will be followed.

j. Warranties

(1) General. The objectives of the Marine Corps Warranty Program, as stated in MCO 4105.2, are to ensure that the weapon systems procured: (1) perform as required; (2) conform to the design and manufacturing requirements specified; (3) are free from defects in materials and workmanship; and (4) contribute to increased readiness throughout the Marine Corps. M1A1 warranty administration is the responsibility of the Commanding General, MCLB (Code 833-3), Albany, GA 31704. The manufacturer of the M1A1 Abrams Tanks is General Dynamics Land Systems Division, P.O. Box 1743, Warren, MI 48090. The warranty on the M1A1 tank is acquired from the contractor via the U.S. Army. All M1A1 warranty provisions are "transparent" to the using unit. Reimbursements are made to the Government, but no reimbursements, either materiel or monetary, are made to using units. The DD Form 250 acceptance date for each tank determines the start date for the warranty period of each warranted component. The DD Form 250 acceptance date for a tank is contained in its Weapons Record Book. Additionally, it may be obtained upon request from the Commander, TACOM (AMSTA-MMAP), Warren, MI 48397-5000.

ENCLOSURE (1)

(2) Systems, Durations, and Provisions. The warranty covers the following specific items of the M1A1:

(a) Transmission. The X1100-3B Transmission, manufactured by Detroit Diesel Allison Division, General Motors Corporation, is covered for 19 months from the date of vehicle acceptance. The warranty does not apply to spare transmissions or to any final drives. Any failed component is warranted during the warranty period.

(b) Engine. The AGT 1500 Engine (rear gear box, accessory drive gear box, reduction gear box, forward module, and rear module), manufactured by Textron Lycoming, is warranted for 15 months from the date of vehicle acceptance. The warranty provisions do not apply to spare engines. Any failed component is warranted during the warranty period.

(c) Vehicle/Chassis. All fourth and fifth-echelon components ("H" and "D" coded items) are warranted for 15 months from the date of vehicle acceptance.

(3) Field Actions Required to Keep M1A1 Tank Warranty Current

(a) Alterations/Modifications. Unauthorized alterations and modifications to the vehicles shall not be performed.

(b) Nullification

1 Warranty provisions do not apply to defects or failures resulting from:

a Improper Government installation, operation, or maintenance of item(s) under warranty.

b Unauthorized Government modification and/or repair.

c Combat damage.

d Accidental damage.

e Acts of God.

f The Government's use of unapproved supplies.

g Misuse or abuse of supplies.

ENCLOSURE (1)

h Subversion, riots, vandalism, sabotage or fire/explosion from sources external to the warranty items.

2 Either of the following events will void a part's warranty:

a The contractor does not receive initial notification within 60 days of replacement of a failed warranted component.

b The contractor does not receive final notification within 120 days of warranted component repair/identification of lowest failed component(s).

(c) Identification of Failed Items. When the lowest failed component(s) is identified, it will be tagged using NAVMC 1018 (Inspection/Repair Tag). It will be retained for 30 days after final notification is provided to the warranty administrator. While the warranty claim is being processed, the item will be adequately handled and stored to prevent improper repair, use, disposal, or cannibalization.

(4) NSN's Covered by Warranty. The components/NSN's listed in appendix Y are under warranty coverage.

(5) Field Actions Required Wherein Warranted Item Fails. Certain procedures must be followed by the user of equipment under warranty contracts to ensure the warranty claim system will function as intended.

(a) Responsibilities

1 Warranty coordinators shall be appointed within both Fleet Marine Forces. These warranty coordinators will ensure that warranty coordinators are appointed at all subordinate commands possessing intermediate maintenance capabilities.

2 Warranty coordinators are the focal point for coordinating all warranty actions between the using unit and the warranty administrator.

3 Warranty coordinators provide information to the using units on warranty coverage and exclusions, clarify warranty claim issues, and provide assistance to implement the system warranties.

4 CG, MCLB (Code 833-3), Albany shall be the single point of contact between the Marine Corps and TACOM/AMCCOM

ENCLOSURE (1)

concerning warranty matters and shall act as the Marine Corps warranty administrator.

(b) Notification of Warranty Defect

1 The using unit will immediately notify the warranty coordinator when a warranted item has failed. Warranty coordinators shall notify the warranty administrator immediately thereafter via the chain of command. The warranty administrator will notify the TACOM and/or AMCCOM warranty administrator, as appropriate. Initial notification of the failure of a warranted item must be made to the TACOM and/or AMCCOM warranty administrator within 60 days of replacement of a failed LRU or assembly and must contain the item's serial number. Final notification must be made within 120 days of identification of the lowest failed component(s) and must reference the initial notification.

2 Warranty coordinators within the chain of command will receive copies of all warranty related reports. They have the responsibility for planning, execution, and monitoring of all warranty matters within the designated command. They will possess an overall perspective of the warranty related problems of the using units within the designated command/area.

3 The TACOM and/or ASMCCOM warranty administrator shall provide any special disposition instructions to the warranty administrator, if appropriate.

4 Upon receipt of any special disposition instructions, the warranty administrator will expeditiously notify the appropriate command of required actions.

(6) Warranty Coverage. The contractor warrants that all M1A1 vehicles and parts listed in appendix Y are free from defects in design, material, and workmanship, and will conform with the specifications contained in the Engineering Release Records. The contractor will reimburse the Government for the cost of replacing/repairing warranted items.

(7) Warranty Claims Processing. All warranty claims will be reported using Quality Deficiency Report (QDR) (SF 368) message format in accordance with MCO 4855.10. The QDR includes the Vehicle Identification Number (VIN), serial number of failed item (if applicable), and identifies the communicate as warranty related.

ENCLOSURE (1)

(8) Safety Recall

(a) if a safety recall occurs during the equipment warranty period, the term of the warranty for each piece of equipment involved may be extended on an item-by-item basis by a period equal to the time required to make necessary safety defect corrections on each piece of equipment. Extensions of warranty coverage shall be annotated in the remarks section of the Weapons Record Book.

(b) Once it has been determined by TACOM and/or AMCCOM that a problem is safety related, appropriate instructions will be furnished to CG, MCRDAC and CG, MCLB (Code 833-3), Albany for appropriate Marine Corps action.

(c) The contractor, as defined by the terms of the contract, shall remedy safety defects or failures, including the replacement or correction of defective parts in the Government inventory.

4. Actions Required To Place Equipment In Service

a. General. This section lists major actions and responsible organizations to coordinate fielding of the M1A1 and associated equipment.

b. Gaining Commands

(1) Commanding General, Fleet Marine Force, Atlantic

(a) Appoint a single POC, at each of the following levels, responsible for coordinating the fielding of the M1A1 and ancillary equipment:

1 2d Marine Division

2 2d FSSG

2d Tank Battalion

(b) Host TPF conferences at the fielding site to coordinate all schedules, locations, and support requirements.

(c) Budget for/requisition all Class II expendables, Class III, and Class V items to be on hand to support the fielding schedule.

(d) Ensure security measures prescribed in appendix W are established prior to initial delivery of the M1A1.

ENCLOSURE (1)

20 Aug 91

(e) Appoint warranty coordinators to implement warranty procedures and expedite warranty actions, as required.

(f) Cycle tank companies through NET at MCAGCC per appendix E.

(g) Provide specified administrative, logistics, and personnel augmentation support to the Deprocessing Team and FSR's.

(h) Conduct joint inventory of end items, ancillary equipment, and initial spares/repair parts concurrently with the MFT.

(i) Sign joint inventory forms, report receipt/acceptance of materiel, post documentation, and establish equipment accountability.

(j) Report acceptance of warranted items in accordance with MCO 4105.2.

(k) Report any deficiencies and/or problems relevant to the fielding process to CG, MCRDAC (CBGT) prior to acceptance.

(l) Assign radiological safety officers in accordance with TI 5104-15/2A.

(m) Ensure compliance with laser safety requirements contained in MCO P3570.1.

(n) Effect T/E and T/O structural conversions per the direction of CMC (P).

(o) Place the M1A1 and ancillary equipment in service per reference (a), "Policy for Logistics Support for New Equipment Introduced into the Marine Corps."

(p) Retrograde M60A1 R/P tanks and associated equipment in accordance with instructions solicited from CG, MCLB, Albany.

(q) Conduct readiness reporting per MCO P3000.11 AND MCO P3000.13.

(r) Receipt for O&M (New Equipment) funding from CG, MCRDAC, and distribute to subordinate commands as required.

(s) Coordinate M1A1 related formal school requirements, if required, with CG, MCDC (TE 33).

ENCLOSURE (1)

(t) Establish an identifier code within JONs to track M1A1 fielding.

(u) Coordinate U-COFT site selections with CG, MCB, Camp Lejeune, NC.

(v) Make appropriate entries in MMS and service records for Marines who successfully complete M1A1 NET.

(2) Commanding General, Fleet Marine Force, Pacific

(a) Appoint a single POC, at each of the following levels, responsible for coordinating the fielding of the M1A1 and ancillary equipment:

1 7th Marine Expeditionary Brigade

2 1st FSSG

3 3d Tank Battalion

4 CSSD-12

(b) Host TPF conferences at each fielding site to coordinate all schedules, locations, and support requirements.

(c) Budget for/requisition all Class II expendables, Class III, and Class V items to be on hand to support the fielding schedule.

(d) Ensure security measures prescribed in appendix W are established prior to initial delivery of the M1A1.

(e) Appoint warranty coordinators to implement warranty procedures and expedite warranty actions, as required.

(f) Cycle tank companies through NET at MCAGCC per appendix E.

(g) Provide specified administrative, logistics, and personnel augmentation support to the Deprocessing Team, NETT, and FSR's.

(h) Conduct joint inventory of end items, ancillary equipment, and initial spares/repair parts concurrently with the MFT.

(i) Sign joint inventory forms, report receipt/acceptance of materiel, post documentation, and establish equipment accountability.

ENCLOSURE (1)

(j) Report acceptance of warranted items in accordance with MCO 4105.2.

(k) Report any deficiencies and/or problems relevant to the fielding process to CG, MCRDAC (CBGT) prior to acceptance.

(l) Assign radiological safety officers in with TI 5104-15/2A.

(m) Ensure compliance with laser safety requirements contained in MCO P3570.1.

(n) Effect T/E and T/O structural conversions per the direction of CMC (P).

(o) Place the M1A1 and ancillary equipment in service per reference (a).

(p) Retrograde M60A1 R/P tanks and associated equipment in accordance with instructions solicited from CG, MCLB (Code 833-3), Albany.

(q) Conduct readiness reporting per MCO P3000.11 and MCO P3000.13.

(r) Receipt for O&M (New Equipment) funding from CG, MCRDAC, and distribute to subordinate commands as required.

(s) Coordinate M1A1 related formal school requirements, if necessary, with CG, MCCDC (TE 33).

(t) Establish an identifier code within JON's to track M1A1 fielding.

(u) Coordinate U-COFT sites selection with CG, MCAGCC.

(v) Make appropriate entries in MMS and service records for Marines who successfully complete M1A1 NET.

(3) Commanding General, Fourth Marine Division

(a) Select and prepare M-COFT sites in accordance with requisite standards.

(b) Cycle tank companies and I-I staffs through NET at MCAGCC per appendix E.

(c) Effect T/E and T/O structural conversions per the direction of CMC (P).

ENCLOSURE (1)

(d) Retrograde M60A1 R/P tanks and associated equipment in accordance with instructions solicited from CG, MCLB, Albany.

(e) Coordinate M1A1 related formal school requirements, if necessary, with CMC (MO) and CG, MCCDC (TE 33).

(f) Coordinate M-COFT site selections with host activities.

(g) Make appropriate entries in MMS and service records for Marines who successfully complete M1A1 NET.

(h) Provide specified support to M-COFT FSR's.

c. Commanding General, Marine Corps Logistics Base, Albany, GA

(1) Procure M1A1 initial spares/repair parts packages via funded MIPR to the Commander, TACOM, Warren, MI 48397-5000. Ensure that adequate system stock is procured to support M1A1 fielding.

(2) Convert 296 .50 caliber M2 machineguns to .50 caliber M2, turret type (M48) machineguns. Effect delivery of M2 and M240 machineguns to field commands per appendix M.

(3) Ensure security measures prescribed in appendix W are established prior to initial delivery of the M1A1.

(4) Act as warranty administrator to implement warranty procedures and expedite warranty actions per MCO 4105.2.

(5) Assign radiological safety officers in accordance with TI 5104-15/2A.

(6) Ensure compliance with laser safety requirements contained in MCO P3570.1.

(7) Provide specified administrative, logistics, and personnel augmentation support to the Deprocessing Team and FSR's.

(8) Conduct joint inventory of end items and ancillary equipment with the MFT.

(9) Sign joint inventory forms, report receipt/acceptance of materiel, post documentation, and establish equipment accountability.

ENCLOSURE (1)

(11) Report any deficiencies and/or problems relevant to the fielding process to CG, MCRDAC (CBGT).

(12) Provide retrograde instructions for M60A1 R/P tanks and associated equipment when requested by field commands and/or when directed by CMC (P).

(13) Assume logistical support responsibility for M1A1 and ancillary equipment in accordance with the provisions of MCO 4105.1 "Weapon System/Equipment Support Management within the Marine Corps."

(14) Assume responsibility for training MPS maintenance personnel.

d. Marine Corps Posts and Stations

(1) Commanding General, Marine Corps Air-Ground Combat Center, Twentynine Palms, CA

(a) Make necessary facilities preparations to support M1A1 fielding.

(b) Coordinate U-COFT and M-COFT site selections and site surveys with appropriate tenant commands and CMC (LF).

(c) Prepare COFT sites in accordance with requisite standards.

(d) Provide required support to the NETT.

(e) Provide required support to units undergoing NET.

(2) Commanding General, Marine Corps Base, Camp Lejeune NC

(a) Make necessary facilities preparations to support M1A1 fielding.

(b) Coordinate U-COFT and M-COFT site selections and site surveys with appropriate tenant commands and CMC (LF).

(c) Prepare COFT sites in accordance with requisite standards.

ENCLOSURE (1)

20 Aug 91

e. Commanding General, Marine Corps Research, Development, and Acquisition Command, Quantico, VA

(1) Assume overall responsibility for the fielding of the M1A1 and ancillary equipment.

(2) Assign an M1A1 Project Officer (Major) to provide onsite control, coordination, and oversight of the overall fielding process.

(3) Establish and direct the activities of an M1A1 NETT.

(4) Schedule and chair TPF conferences at gaining commands.

(5) Coordinate all TPF requirements and activities between gaining commands, CG, MCLB, Albany, and Commander, TACOM.

(6) Conduct NET at MCAGCC per appendix E.

(7) Provide O&M (New Equipment) funding to each gaining command for its first year of M1A1 operation.

(8) Provide formal, timely notification to the commands of Marines that successfully complete, as well as fail to complete, M1A1 NET.

POL (CLASS III)

DESCRIPTION OF POL PRODUCTS

DF-2: Diesel fuel, number 2 grade.

Grease A/C, MIL-G-81322 used for common lubrication of bearings in many combat and tactical vehicles.

CT CORROSION PREV COMPOUND: Cable, tow, corrosion preventive compound. Tow cables are cleaned with dry cleaning solvent P-D-680 and coated with corrosion preventive compound. This compound resists water and is often used to coat the surface of disassembled repair parts.

CLP: Cleaner, lubrication and preservative for weapons and weapon systems.

DEXTRON II: Traversing mechanism oil, for M1A1.

HYDRAULIC FLUID: Rust inhibitor, fire resistant synthetic hydrocarbon fluid used for turret system operation.

WTR GREASE, AIRCRAFT: General purpose, MIL-G-81322.

OE-30: Engine Oil (number designates viscosity of oil).

OIL, TURBINE: Special oil designated for M1A1 turbine engines.

BRAKE FLUID, SILICON: Special synthetic base fluid used for all Marine Corps equipment.

CLEANING SOLVENT: P-D-680 used for cleaning all metals; also provides a small amount of preservative.

OEA: Lubricating oil, MIL-L-46167, used for M1A1 shock absorbers.

PL-M: Lubricating oil, MIL-L-3150, preservative used to lubricate clevises, pins, hinges, pulleys, and latches.

PL-S: Lubricating oil, general purpose used for ballistic shield bellcranks, hinges, door latches, grille door hinges, and crosswind hinges.

LUBE, SOLID FILM: Used for lubrication of skirt hinge pins for M1A1 MIL-L-23398.

Appendix K to
ENCLOSURE (1)

M1A1 TANK SYSTEM AMMUNITION

1. GENERAL. The M1A1 tank system is supported with the following ammunition items (see legend at end of paragraph):

a. MAIN ARMAMENT AMMUNITION

<u>DODAC</u>	<u>P/S</u>	<u>WR Only</u>	<u>WR& TNG</u>	<u>TNG Only</u>	<u>Nomenclature</u>
1315-C786	P	X			Ctg, 120mm APFSDS-T M829A1
1315-C787	P		X		Ctg, 120mm HEAT-MP-TM830
1315-C784	P			X	Ctg, 120mm TP-T M831
1315-C785	P			X	Ctg, 120mm TPCSDS-T

b. MACHINE GUN, M2HB, .50 CALIBER

1305-A576	P		X		Ctg, .50 cal 4 API, 1 API-T
1305-A543	S			X	Ctg, .50 cal API, M20 (used with Telfare)
1305-A585	S			X	Ctg, .50 cal API, M20 (used with Telfare)
1305-A598				X	Ctg, .50 cal blank M1A1 (used with MILES)

c. MACHINE GUN, M240, 7.62 mm

1305-A111	P			X	Ctg, 7.62mm blank
1305-A131	P		X		Ctg, 7.62mm 4 ball, 1 tracer

d. LAUNCHER, SMOKE GRENADE, M257

1330-G826	P		X		Grenade, smoke, infrared M76
1330-G815	P		X		Grenade, smoke L8A3
1330-G815	S		X		Grenade, smoke L8A1

e. ADDITIONAL AMMUNITION ITEMS IN SUPPORT OF THE CREW

(1) RIFLE, M16A2

1305-A059	P		X		Ctg, 5.56mm ball M855 (10/clip)
1305-A071	S		X		Ctg, 5.56mm ball M193 (10/clip)
1305-A063	P		X		Ctg, 5.56mm tracer M856 (Ctn pack)
1305-A068	S		X		Ctg, 5.56mm tracer M196 (10/clip)
1305-A080	P			X	Ctg, 5.56mm blank M200

(2) HAND GRENADES

1330-G881	P		X		Grenade, hand, fragmentation M67
1330-G811	P			X	Grenade, body, practice M69
1330-G878	P			X	Grenade, fuze, practice M228

Appendix L to
ENCLOSURE (1)

f. LEGEND

(1) Department of Defense Ammunition Code (DODAC)--an eight-character designation comprised of the federal supply class (first four digits) and the Department of Defense identification code (DODIC) (last four characters). The DODAC (or DODIC) completely identifies the item of ammunition.

(2) P/S--prime/sub--this column identifies which items are considered prime (P) and which are authorized substitutes (S). The substitute items immediately follow the prime within the group being considered.

(3) WR only--items identified with an X in this column are authorized for war reserve (WR) stocks but are not authorized for use in training.

(4) WR & TNG--items identified with an X in this column have both war reserve and training applications. Paragraph above applies except that they are authorized for training as well.

(5) TNG only--items identified with an X in this column are training-unique. These items are not authorized nor required in war reserves nor would they be needed for basic load.

(6) Nomenclature--self explanatory.

2. AMMUNITION REQUIREMENTS IN SUPPORT OF NEW MATERIEL FIELDING

a. The M1A1 tank system will be fielded with sufficient ammunition to cover requirements in paragraphs 2b through 2c below. With the exception of the 120mm cartridges and the M76 IR Grenade, all ammunition items are mature, support other systems, and are available in the supply system as limited only by the current available supply rate (ASR) established by MCRDAC (AM).

b. COMBAT PLANNING RATES (CPR)

(1) Definition: CPR reflect the anticipated expenditure of ammunition per weapon over designated periods of combat operations. These rates are intended to be used for procurement guidance, transportation and resupply requirements planning, and storage facilities planning. The 60-day rates represent the maximum quantity the Marine Corps can procure or keep on hand.

20 Aug 91

(2) Current rates are:

30-DAY RATE

	ASSAULT		60-DAY RATE
	INTENSE	SUSTAINING	
1315-C786	64.8	23.1	129.6

c. AMMUNITION REQUIREMENTS FOR ANNUAL TRAINING. There are three phases of tank gunnery training based on FM 17-12-1, which are used to compute the annual ammunition requirement:

(1) The basic Phase establishes individual crewman skills and crew collective skills using subcaliber devices, dry fire, and simulation. Table I through IV are used to meet this semi-annual requirement.

Table I - Basic Gunnery Skills (Individual).

Table II - Basic Gunnery Course (Individual/Crew).

Table III - Basic Training Course (Crew).

Table IV - Tank Crew Proficiency Course (TCPC).

(2) The Intermediate Phase develops crew skills on the tables V, VI, VII and culminates in crew qualification on table VIII. This is a semi-annual requirement which immediately follows the basic phase.

Zero - Main Gun and Machineguns

Table V - Preliminary Machinegun Training

Table VI - Preliminary Main Gun Training

Table VII - Intermediate Training Course

Table VIII - Intermediate Qualification Course

(3) The Advanced Phase develops section and platoon coordination on table IX and XI and culminates with section and platoon annual qualification on tables X and XII.

Table IX - Advanced Training Course (Section)

Table X - Advanced Training Course (Platoon)
(Section)

Table XI - Advanced Training Course (Platoon)

Table XII - Advanced Qualification Course
(Platoon)

(4) Ammunition requirements for each table within the three phases are listed in Tables L-1 through L-4. All figures given are rounds per tank whether firing singly, within a section, or within a platoon. The first number in each entry (10/20) represents the requirement for one iteration followed by the annual requirement for two iterations of the training table (10/20). The letter "A" denotes Day Tables; the Letter "B" denotes Night Tables.

f. M1A1 TANK AMMUNITION REQUIREMENTS FOR THE COMBINED ARMS EXERCISE (CAX) PROGRAM. Tank gunnery in the CAX program will be conducted in three phases. Phase one involves establishing a zero for the tank's weapons; in phase two, the tank unit participates in Pre-CAX training (Mobile Assault Course); phase three is the actual exercise. The anticipated changes to ammunition requirements for the M1A1 are due to the M1A1 tank's improved fire control system and the additional loader's 7.62mm M240 machine gun.

Table L-10--CAX AMMUNITION REQUIREMENTS.

3. AMMUNITION ITEM DESCRIPTIONS

a. CARTRIDGE 120 mm APFSDS-T M829A1. The armor-piercing, fin-stabilized, discarding-sabot tracer M829a1 cartridge is a kinetic energy round. The complete round contains a propulsion system consisting of a metal cartridge case base with combustible sidewall, granular propellant JA2 within containment bags, and the M125 primer. The projectile consists of the subprojectile and aluminum sabot. Upon leaving the gun, aerodynamic forces cause the sabot to separate from the subprojectile. Target penetration is affected strictly by the high kinetic energy of the subprojectile's high density core, staballoy ((depleted uranium) (DU)), when it impacts. Procedures for handling fires involving DU tank ammunition have been developed and incorporated in appropriate munitions manuals and publications.

b. CARTRIDGE 120 mm HEAT-MP-T M830. The high explosive antitank, multipurpose (antiarmor and antipersonnel capabilities) tracer M830 cartridge consists of a steel body loaded with composition A3 typeII explosive surrounding a copper-shaped charge liner and wave shaper. The round has a metal cartridge base with combustible sidewall, M123 primer, and DIGL-RP stick propellant in six individual bags. The projectile body has a

Appendix L to
ENCLOSURE (1)

20 Aug 91

boom and fin assembly providing flight stabilization. The tracer is part of the fin. The M764 fuze provides for both nose and shoulder activation to assure full frontal and graze initiation.

c. CARTRIDGE, 120 mm TP-T M831. This cartridge is a target practice round used to simulate the ballistics of the M830 high explosive antitank multipurpose with tracer ammunition. The M831 cartridge external appearance is similar to that of the M830. Internally the round does not contain any explosives, shaped charge liner, base fuze, or impact switches. The round consists of a steel body with aluminum spike in addition to a fin and boom assembly with tracer. The round has a metal cartridge case base with combustible sidewall and M123 primer, and DIGL-RP stick propellant in six individual bags.

d. CARTRIDGE 12 mm TPCSDS-T M865. The target practice cone stabilized discarding sabot-tracer M865 is a kinetic energy cartridge. It is designed to duplicate the M829A1 characteristics. The round has a metal cartridge case base with combustible sidewall, granular single base propellant within containment bags, and the M125 primer. The projectile consists of the subprojectile and aluminum sabot. The stabilizing cone, consisting of nine holes, limits range to 800 m. Even though this is a target practice round, the core can cause damage and penetrate armored vehicles.

e. GRENADE, SMOKE IR M76. The M76 grenade consists of a plastic cylindrical main body containing an IR composition and a high explosive central burster, a safe and arm mechanism, a pyrotechnic delay, launch propellant, and electric match. The electric match, when initiated, ignites the propellant which discharges the grenade from the launcher. The burster charge, which activates 1.7 seconds after discharge, ruptures the plastic grenade body and disperses the mixture. The smoke screen forms 2 to 5 seconds after firing. The grenade, when fired from the smoke grenade launcher mounted on a vehicle, forms a cloud 7 meters high and obscures an arc of over 100 degrees, 30 meters in front of the vehicle. Cloud duration is approximately 45 seconds.

f. GRENADE, SMOKE SCREENING L8A3. The grenade consists of a rubber cylindrical body and a metal base. The rubber body contains 360 grams of red phosphorus/butyl rubber in a 95/5 proportion and a central plastic burster tube containing a burster charge of 1 gram of black powder. The metal base contains the electrical clips, F9 squib-type electric fuze, propellant charge (3.0 grams of black powder), and the delay assembly with delay composition (0.25 grams of black powder).

5. CHARGE, LINEAR DEMOLITION, HE, M58A4 (1375-00-000-0000M913).
Towing the MK 2 MOD 0 Mine Clearance System behind the M1A1 is prohibited. The extreme heat of the M1A1's exhaust system can ignite the M58 or M68 linear charge and the M22 rocket carried on the trailer.

6. 120 mm TANK SABOT AMMUNITION CARTRIDGES. Vulnerability tests indicate that M865 KE sabot training rounds may detonate rather than burn when impacted by other large caliber munitions, including another M865 round. The propellant causing this detonation is also found in the Federal Republic of Germany (FRG) equivalent DM38 120mm sabot and DM128 105mm sabot. Under similar conditions, all other 105mm sabot. Under similar conditions, all other 105mm and 120mm cartridges burn rather than detonate.

a. The potential exists during night firing exercises that vehicles can be mistakenly identified as targets, especially from
Appendix L to
ENCLOSURE (1)

MCO 8420.13
20 Aug 91

the rear, due to engine exhaust gases. Accordingly, it is possible that one tank could fire into the rear of another tank and impact the ammunition. The rear portion of the tank is not as heavily armored as the front.

b. Of particular concern are conditions where an uploaded tank is positioned or moving forward of another firing tank. Inadvertent engagement in the area of least armor protection could yield catastrophic detonation of ammunition in the ready, semi-ready, and hull ammunition racks. Extreme caution must be exercised in training events where these conditions exist.

M1A1 SECURITY CLASSIFICATION GUIDE

Appendix W to
ENCLOSURE (1)

W-1

M1A1 TANK SECURITY CLASSIFICATION GUIDE

SECTION 1 - GENERAL INFORMATION

1. Purpose. The purpose of this document is to provide instructions and guidelines for the Marine Corps on the security classification of information and material pertaining to the M1A1 Main Battle Tank as classified by the U.S. Army. In addition, security procedures for protection of the system as it relates to the Marine Corps are contained within this document. The guide will be utilized in the preparation of DD Form 254, "Department of Defense Contract Security Classification Specification," issued to defense contractors performing on the program. Further, it is the intent of this guide that all good judgment and common sense should be employed to protect the tank and its components from any person/persons who might compromise its decisive edge in combat. This guide will be reviewed for accuracy and currency on a biennial basis. The highest level of information classified by this guide is SECRET. This guide is UNCLASSIFIED. The text of this guide is amplified by Annexes II through XIV.

2. Authority. The information contained in this guide is classified by authority of Commander, U.S. Army Tank-Automotive Command, Warren, MI, 48397-5000. This guide is prepared by the Commanding General, MCRDAC (CBGT), Quantico, VA 22134, from information contained in the "Security Classification Guide for Abrams Tank System," dated 25 Apr 91, issued by the Program Executive Officer, Armor Systems Modernization, Warren, MI 48397-5000.

3. Application. Changes in classification required by this guide will be made immediately.

4. Questions and Recommendations. Questions concerning the content and interpretations of this guide should be directed to the preparing activity. If the security classifications imposed by this guide are considered impracticable, documented (written) and justified recommendations should be made through appropriate channels to the preparing activity. If current conditions or progress made in this effort, scientific or technological developments, advances in the state of the art, or other factors indicate a need for change, similar written recommendations should be made. Pending a final decision, the information will be protected at either the current level or the recommended level, whichever is higher. Overclassification or incorrect classification should be brought to the attention of the preparing activity immediately. Any and all users of this guide are encouraged to assist in improving its currency and accuracy.

Annex I to
Appendix W to
ENCLOSURE (1)

5. Public Release. The fact that this guide shows certain details of information to be unclassified does not allow automatic public release of them. Proposed public disclosures of unclassified/distribution "A" information regarding the M1A1 Tank shall be processed through appropriate publication approval channels. Defense contractors will comply with the instructions contained in the "Department of Defense Contract Security Classification Specification" DD Form 254, and paragraph 50 and Appendix IX of DoD 5220.22M, the "Industrial Security Manual For Safeguarding Classified Information."

6. Definitions. (Annex II).

7. Foreign Government Information and Foreign Military Sales. This program is subject to the Foreign Military Sales (FMS) Program. For information that could be disclosed by FMS, see paragraph 23a(3), Section 7.

SECTION 2 - OVERALL EFFORT

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
8. Identification (nomenclature, part and identification numbers, code name and model designation	U	1	
9. Goal, mission, purpose, military application	U	1	
10. End Item:			
a. External view.	U	1	
b. Internal view.	U	1	
11. Main Weapon System:			
a. M256, 120mm cannon.	U	1	
b. Armament Enhancement Initiative (AEI).	U	1; 4	

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
12. Complementary Weapons:			
a. .50 caliber machine gun.	U		1
b. 7.62mm machine gun.	U		1
13. Drawings, sketches or photographs:	U		Not revealing thickness of armors.
a. Showing thickness of armor cavities. (Example: turret left, right).	C	OADR	2
b. Photograph of an armor section with threat projectile.	S or S-SAR	OADR	2
c. Identifying thickness and material of a conventional armor plate but not showing the location on the tank.	U		1
d. Showing build-up of hull and turret structures with no reference to special armor design, configuration or specific location.	U		1
e. Any compilation of individually unclassified documents, technical drawings, sketches, briefings, photographs, mockups or parts which in total reveals the tank system design and/or reveals plans to improve the armor protection of the M1A1 vehicle.	C	OADR	Example: ECP documents with individual pertaining to armor components.
			Annex I to Appendix W to ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
f. Any compilation of individually unclassified armor component detail drawings showing length, width and thickness of Special Armor, Improved Special Armor and Heavy Armor.	S or S-SAR	2	
g. External view of ballistic hull and turrets. Not showing any armor design information, configuration or location.	U	1	
h. Skeleton turrets waiting armor installation	U	1	

SECTION 3 - PERFORMANCE AND CAPABILITIES

14. Main Weapon System:

a. M256 120mm cannon (rate of fire).	U	1; 4	
b. Performance and hit/kill probabilities of the M256 cannon, when associated with type of ammunition used.	C	OADR 2; 4	

15. Complementary Weapons:

a. .50 caliber machine gun.	U	1	
b. 7.62 mm machine gun.	U	1	

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
16. Fire Control:			
a. Thermal imaging night vision devices (range and resolution).	C	OADR	Technical specifications and software only. Does not preclude normal crew training; 2; 4
b. Field of view for thermal imaging night vision device.	U	OADR	1; 4
c. Forward Looking Infrared (FLIR) ranging device (compilation of range data in conjunction with FLIR performance - threshold of detection).	C	OADR	Technical specifications and software only. Does not preclude normal crew training; 2; 4
d. Stabilization System.	U		1
e. Carbon Dioxide Laser Rangefinder Counter-measures/ Counter-Counter-measures (CM/CCM).	U		1; 4
f. Optical Improvement Program (OIP).	U		1; 4

SECTION 4 - SPECIFICATIONS

17. Production characteristics:

a. Specialized manufacturing specifications, processes for unique performance or producibility of night vision systems or components.	C	OADR	2; 4
---	---	------	------

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
b. All automotive RAM-D criteria such as fuel capacity and consumption, weight, crew size, ammunition capacity and location.	U		1; 4
c. Details of specifications showing reliability of main gun ammunition.	C	OADR	2; 4
d. All reliability and maintainability statistical data.	U		1; 4
e. Details of Vetronics systems including bus architectures, operation, and interface requirements.	U		1; 4

SECTION 5 - CRITICAL ELEMENTS

18. Special Armor:

a. Specific location of special armors.	U		1
b. Phenomenology of Special Armor.	S	OADR	2
c. Information revealing vulnerabilities to nuclear, chemical or biological conditions.	S	OADR	2
d. All Special Armor designs/configurations/etc., to include, but not limited to, test section, range targets interim, final designs or equivalent documentation, to include a list of materials.	S	OADR	2

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
e. All Special Armor fabrication techniques as described in the Technical Data Package (TDP).	S	OADR	2
f. Physical characteristics of Special Armor.	S	OADR	2
g. Methods of assembly employed to make a Special Armor design.	S	OADR	2
h. Armor scrap resulting from the Special Armor production process which discloses armor composition, configuration, and/or any other information covered by this guide.	S	OADR	2; 4; 5
i. Any final dimension, to include, length, width, thickness, and weight of a Special Armor Package.	S		2
j. Individual armor component detail drawings showing length, width, and thickness.	U		1; 4
k. Overall weight and/or areal density of the armor when associated with Special Armor.	S	OADR	2
l. The ability or inability of Special Armor to defeat threat projectiles.	S	OADR	2

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
19. Improved Special Armor:			
a. Knowledge that Improved Special Armor is installed in the turret front of IPM1 and M1A1 tanks.	U		1
b. Phenomenology of Improved Special Armor.	S-SAR	OADR	2
c. Information revealing vulnerabilities to nuclear, chemical or biological conditions.	S-SAR	OADR	2
d. All Improved Special Armor designs/configurations/etc., to include, but not limited to, test sections, range targets interim, final designs or equivalent documentation.	S-SAR	OADR	2
e. All Improved Special Armor fabrication techniques as described in the Technical Data Package (TDP).	S-SAR	OADR	2
f. Physical characteristics of Improved Special Armor.	S-SAR	OADR	2
g. Methods of assembly employed to make a Improved Special Armor design.	S-SAR	OADR	2
h. Armor scrap resulting from the Improved Special Armor production process which discloses armor composition, configuration, and/or any other information covered by this guide.	S-SAR	OADR	2; 4; 5

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
i. Any final dimension, to include, length, width, thickness, and weight of Improved Special Armor Packages.	S-SAR	OADR	2
j. Overall weight and/or areal density of the armor when associated with Improved Special Armor.	S-SAR	OADR	2
K. The ability or inability of Improved Special Armor to defeat threat Projectiles.	S-SAR	OADR	2
20. Heavy Armor (DU):			
a. Identifying an M1A1 tank as having Heavy Armor.	U		1
b. Knowledge that Heavy Armor will be installed in the turret of M1A1 tanks.	U		1
c. Phenomenology of Heavy Armor.	S-SAR	OADR	2
d. Information revealing vulnerabilities to nuclear, chemical or biological conditions.	S-SAR	OADR	2
e. All Heavy Armor designs/configurations/etc., to include, but not limited to, test sections, range targets interim, final designs or equivalent documentation.	S-SAR	OADR	2

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
f. All Heavy Armor fabrication techniques as described in the Technical Data Package (TDP).	S-SAR	OADR	2
g. Physical characteristics of Heavy Armor.	S-SAR	OADR	2
h. Method(s) of assembly employed to make a Heavy Armor design.	S-SAR	OADR	2
i. Armor scrap resulting from the Heavy Armor production process which discloses armor composition, configuration, and/or any other information covered by this guide.	S-SAR	OADR	2; 4; 5
j. Any final dimension, to include, length, width, thickness, and weight including package and detail parts.	S-SAR	OADR	2
k. Overall weight and/or areal density of the armor when associated with Heavy Armor.	S-SAR	OADR	2
l. The ability or inability of Heavy Armor to defeat threat projectiles.	S-SAR	OADR	2

SECTION 6 - VULNERABILITIES AND WEAKNESSES

21. Total Tank System:

a. Vulnerability to ballistic threats.	C thru S-SAR	OADR	2; 4
--	-----------------	------	------

Annex I to
Appendix w to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
b. Performance against postulated small arms threats.	C	OADR	2; 4
c. Protection afforded against all small arms and overhead artillery.	C	OADR	2; 4
d. Protection afforded and vulnerability to all direct fire large caliber projectiles.	S S-SAR	OADR	2 2
e. Non-ballistic threat known or postulated with known or suspect vulnerabilities to such threats.	C	OADR	2; 4
f. Nuclear and/or electromagnetic effects data.	U		1; 4
g. Protection afforded under NBC conditions.	C	OADR	Relates to Capability to continue combat environment; 2; 4
h. Signature: Noise, Infrared, and/or radar.	U		Unless it relates directly to the determination of vulnerability; 1; 4
i. Laser Counter-measures/ Counter-Counter-measures (CM/CCM).	U		1: 4

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
-----------------------	---------------------	------------------------------------	-------

SECTION 7 - ADMINISTRATIVE DATA

22. Research and development program:

a. Budget year and prior year dollars and quantities. U

b. Future years and total dollars and quantities U

23. Production, procurement and programming:

a. Quantities:

(1) Assets (worldwide); Acquisition Objective (AO); total program. U 1

(2) Assets or programmed quantities by location or command for Marine Corps CONUS and assets overseas units. U Total USMC are unclassified.

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
(3) Foreign Military Sales (FMS) and Military Assistance program highest level of information that could be disclosed by:			
(a) Sale.	S or S-SAR	2 2	
(b) Production.	S or S-SAR	2 2	
(c) Operation.	U	1	
(d) Maintenance.	U	1	
(e) Training.	U		
(f) Reverse Engineering.	S or S-SAR	2 2	
(g) Destructive Testing.	S or S-SAR	2 2	
(4) Total distribution plan.	U	1	
(5) Total USMC program requirements.	U	1	
(6) Total assets and/or equipment status of a USMC Division, comparable size force or larger (consolidated or rolled up).	U		

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
b. Production and delivery:			
(1) Numbers contracted.	U	1	
(2) Production and delivery schedules.	U	1	
(3) Rates of delivery.	U	1	
(4) Production capacity or capability.	U	1	
(5) Shipping dates and times.	U		Although unclassified shipping dates, times and routes are sensitive and not releasable to the public; 1; 4

24. Key scheduling dates:

- a. Initial Operating Capability (IOC). U
- b. Development milestones other than IOC. U

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
-----------------------	---------------------	------------------------------------	-------

SECTION 8 - HARDWARE

25. Composition of hardware items:

a. Fire Control System:

(1) Sighting devices (day and night)	U		Range and resolution of thermal imaging night devices are classified (see 17a): 1: 4
--------------------------------------	---	--	--

(2) Stabilization System.	U		1; 4
---------------------------	---	--	------

c. M256, 120 mm cannon.	U		1; 4
-------------------------	---	--	------

d. Complementary Weapons:

(1) .50 caliber machine gun.	U		1
------------------------------	---	--	---

(2) 7.62 mm machine gun.	U		1
--------------------------	---	--	---

26. Publications:

a. Technical Manuals.	U		Technical manuals, Operating manuals and training materials although unclassified will be provided only to those who have a "need-to-know". Manuals must contain appropriate distribution guidance.
b. Operating Manuals.	U		
c. Training Manuals	U		

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
27. Software:			
a. System Software when loaded into end item or transported on non-alterable media.	U		
b. System Support Software.	U		
28. Documentation, electromagnetic storage devices. Not revealing ballistic performance of ammunition or software security provisions.			
a. Showing ballistic performance of ammunition in higher than object code.	U		
b. Provisions to protect integrity of software other than specific software security provisions, e.g. checksums.	S	4	
c. Existence of Software Security Program.	U		
Annex I to Appendix W to ENCLOSURE (1)			

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
29. Software Specifications:			
a. Not revealing software security provisions.	U		
30. Software Support Hardware and Software:			
a. Software development and support tools.	U		
b. Software downloader for field support.	U		
c. Electromagnetic or optical media for transport or storage of embedded software.	U		
31. Programs.	U		
32. Data Files:			
a. Standard (furnished) files object code or binary.	U		
b. Standard (furnished) files source code or ASCII data. Not dealing with ballistic performance or security provisions.	U		
c. Locally generated files.	C	4	
d. Passwords	U		to be treated as "For Official Use Only"
e. Technical Manuals	U		1; 4

Annex I to
Appendix W to
ENCLOSURE (1)

Information Revealing	Classifi- cation	Declassifi- cation or Review	Notes
f. Operating Manuals	U		1; 4
g. Training Manuals	U		1;4
h. Software Design and Support Documents	U-S		6
33. Goal, mission, purpose, military application.	U		Generic, not referring to or directly relating to any level of requirement per M1A2 S/W Security Requirements (U).
	S	OADR	Dealing with requirements of level 3 and below per M1A2 S/W Security Requirements (U).
	TS	OADR	Dealing with requirements of level 4 and above per M1A2 S/W Security Requirements (U).
34. Documentation Software Security.	S	OADR	Dealing with requirements of Level 3 and below per M1A2 Security Requirements (U).

NOTES

Note 1. Although UNCLASSIFIED, this type of information is not approved for automatic public dissemination.

a. This type of information will be considered OPSEC sensitive, meaning, any unclassified information, the disclosure of which would be of value to hostile intelligence collectors in that analysis of the information would provide useful targeting data, or that would provide insight into information that has been determined to be classified.

b. Do not discuss classified or unclassified national security related information on unsecured telephones. Unprotected telephone conversations of government employees and government contractors are targeted by our adversaries. Extreme caution must be used when discussing any information on unsecured telephones. If secure voice is available, it should be used for all conversations, both classified and unclassified sensitive.

Note 2. Declassify On: Originating Agency's Determination Required (OADR) Declassification/downgrading instructions will be provided by originating authority at the appropriate time(s).

Note 3. To include, but not limited to, blueprints, viewgraphs (VGTs), photographs, videotapes, motion pictures, documents, hardware, computer software and documentation, magnetic tapes, letters, reports, working papers, notes, technical specifications, etc.

Note 4. Classify according to content and this guide. Additional Classification Guides that are relevant are identified on page IW-23 of this classification guide.

Note 5. Prior to disposal of any SAP material as UNCLASSIFIED, PEO, Armored Systems Modernization approval must be obtained. Methods and procedures will be established on a case by case basis. Upon Original Classification Authority approval and technical evaluation declassification will occur only when the material can be completely disassociated from: (a) The SAP program; (b) any indications of how the material was configured in the armor design; and (c) any indication of how the material was ballistically impacted.

Note 6.

a. Documentation identifying system threats without revealing thresholds, system specific details or implementation is classified Confidential.

Annex I to
Appendix W to
ENCLOSURE (1)

b. Documentation identifying system threats revealing thresholds, system specific details or implementation is classified Secret.

c. If neither of the above are identified, the documents are unclassified.

Adelphi, MD 20783

DEFINITIONS

1. Armor - A covering designed to protect against ballistic penetration, especially as used on tanks.
2. Armored Combat Fighting Vehicles - Wheeled or tracked vehicles with an armor hull or body.
3. Armor test section/target "package" - An armor made from any combination of armor materials and designs which will be ballistically impacted or tested in some manner.
4. Assembly - a group of two or more physically connected parts.
5. Compartmentalization - The enhancement of combat survivability by separating the crew from combustibles by armored doors and/or bulkheads.
6. Conventional Armor - A rolled, wrought or forged homogenous monolithic ballistic structure, which may consist of either ferrous or non-ferrous material.
7. Exposure - That which can be seen.
8. Flash Radiograph - A shadowgraph on film, or print that is produced by x-radiation.
9. Heavy Armor (DU) - Turret armor made from Depleted Uranium, identified by a "U" at the end of the turret serial number.
10. Homogenous Armor - Steel armor which has been manufactured and heat treated so that it possesses, as nearly as possible, the same chemical constituents, and physical and mechanical properties, throughout.
11. Improved Special Armor - Turret armor installed in IPM1s and M1A1s only.
12. M1 Abrams Tank System - As utilized within this classification guide, refers to the M1 Basic, M1 Improved, IPM1, M1A1, and M1A2.
13. Nonconventional armor - an armor, or armor design, other than rolled, cast, wrought or forged homogeneous monolithic armor (conventional armor).
14. OADR - Originating Agency's Determination Required.
15. Outline - A line bounding the limits (envelope) of a special armor.

Annex II to
Appendix W to
ENCLOSURE (1)

20 Aug 91

16. Plate - A single sheet of armor material.

17. Program - Planned procurement of a specific quantity of vehicles or major components for any single fiscal year or number of fiscal years.

18. Special Armor - Turret armor on M1s and all other armors on the Abrams family of tanks except turret armors on IPM1s and M1A1s.

19. Special Access Program (SAP) - Any program imposing a must "need-to-know" or access controls beyond those normally provided for access to CONFIDENTIAL, SECRET, or TOP SECRET information under the provisions of OPNAVINST 5510.1H, "Department of the Navy Information and Personnel Security Program Regulation." Such a program may include, but is not limited to, access clearance, adjudication or investigative requirements, and special designation of officials authorized to determine a must "need-to-know."

20. Tank system - The Basic M1, Improved M1, (IPM1) and M1A1 and subsequent series Abrams Tank with all of the complete assemblies of functional components, parts and kits.

Annex II to
Appendix W to
ENCLOSURE (1)

SPECIAL INSTRUCTIONS

1. Special Access Program (SAP). The basic Special Access Program for Special Armor (SAPSA) has been disestablished. Therefore, the special armor skirts and gunshields installed on the M1A1 Tank are no longer under the Special Access Program (SAP) but are now classified as SECRET - No Special Access Required. However, improvements in the tank beyond special armor remain under SAP controls. The specific SAP information contained within the tank will not be revealed except for the fact that the tank now contains Heavy Metal Armor (depleted uranium). The fact that the tank contains depleted uranium was the subject of a public release by Headquarters, Department of the Army (HQDA) on 14 March 1988. All design, manufacturing and performance data on Heavy Armor remains classified under a SAP.
2. Markings. All documents and information containing SECRET or CONFIDENTIAL material shall be marked as SECRET or CONFIDENTIAL. Declassify on: OADR.
3. Access to the Tank. Even though the interior and exterior of the tank are UNCLASSIFIED, only authorized persons with an official need-to-know will be permitted access to the interior. The definition of "Authorized Personnel" is U.S. military or DoD civilian personnel and foreign nationals that have a need for physical access to the tank; e.g., crew, maintenance and security personnel, training technicians, etc. Access to the tank on military installations will be granted to news media personnel, visiting foreign nationals, and others only when they are under escort by DoD civilian or military personnel knowledgeable of the tank system. Access can be granted by the tank battalion commander in coordination with the Security Manager, S2 or G2.
4. Display. The tank will not be made accessible to the general public. Special off-post displays of the M1A1 tank to enhance the relationship of the community must be done with the approval of the first general officer in the chain of command. However, the interior of the tank will remain closed at all times while it is on display. Hatches will be secured to preclude access to the interior by unauthorized persons.
5. Security of the Tank System. The tank must be physically safeguarded at all times. This means that it is never to be left unattended for any reason. Tanks parked outside on tank ramps, storage areas, etc., must be under constant observation by a responsible individual at all times. Structures or buildings utilized for storage of tanks must meet the physical security standards contained within OPNAVINST 5530.14B "DoN Physical Security and Loss Prevention." Standard Operating Procedures (SOP's) will be established by each commander or responsible individual to ensure that the tank and its components are safeguarded and accounted for at all times.

Annex III to
Appendix W to
ENCLOSURE (1)

20 Aug 91

6. Security of Special Armor Skirts Removed from the Tank. Special armor components (skirts and gunshields) removed from the tank will be stored and safeguarded as follows:

a. Stored within an arms room, meeting the security standards contained in OPNAVINST 5530.13 "Physical Security for Sensitive Conventional Arms, Ammunition and Explosives (AA&E)."

b. Stored in a cage constructed of at least 11 gauge wire mesh, equipped with a medium security padlock and hasp or in a locked room affording equal protection. Protective security lighting is encouraged. The storage areas will be designated as "restricted areas" during those periods that special armor components are stored within. Key and lock control procedures will be utilized for the storage area.

c. Except for those areas equipped with Intrusion Detection Systems (IDS), physical checks will be conducted at least every two hours.

d. Special armor components removed from the tank will be treated, secured, and accounted for as SECRET material.

e. Access to the storage area(s) will be controlled at all times. Access procedures will be addressed in the unit or activity SOP.

f. Storage of tanks and components in Maritime Pre-positioning Ships (MPS) and remote sites will be in accordance with the above procedures. However, physical security checks as outlined above are not required while tanks are at sea and in locked storage areas. Hatches may be left open when in storage for purpose of humidity control.

7. Missing Special Armor Components. In the event that a special armor component should be discovered to be missing, a report will be made through command channels to the appropriate level. An immediate search will be conducted to attempt to locate the missing item, utilizing the methods that would be employed to locate any classified or sensitive item. If the item is not located after all reasonable efforts have been exhausted, the Naval Investigation Service (NIS) is to be notified in accordance with OPNAVINST 5510.1H. The Commanding General, MCRDAC (CBGT), Quantico, VA 22134 and the Commander, U.S. Army Tank-Automotive Command (AMLPED-HFM-X), Warren, MI 48397-5000 will be notified.

Annex III to
Appendix W to
ENCLOSURE (1)

20 Aug 91

8. Shipments

a. Initial (first destination) rail shipments from both the Lima Army and Detroit Arsenal Tank Plants are provided for in the Revised Security Plan for Rail Transport of M1A1 Tanks.

b. For shipment of unit tanks (movement to training areas, maintenance shops, etc.), guard(s) (escorts) must accompany all shipments unless the transport vehicle contains at least two individuals or two or more transport vehicles are utilized. Chapter 34 of MCO P4600.14, "Defense Traffic Management Regulations", provides policies and procedures for movement of confidential, secret, and sensitive material, and includes specific instructions for surveillance service for M1A1 tanks.

c. Truck shipments over public highways, roads or streets, must be accompanied by at least two persons, unless two or more trucks are involved. This is in the event of a vehicle breakdown, one person can remain with the shipment while the other calls for assistance. Tanks will not be left unattended on roadways, etc., for any reason.

d. In the event that a tank must be separated for shipment (hull and turret), care must be exercised to ensure that classified components are not revealed when the hull and turret are separated. Security measures must be employed at all times. Separation of the hull and turret for shipment is discouraged.

e. Physical access to the tank interior will be controlled at all times to preclude unauthorized entry. All hatches will be closed and properly secured at all times.

f. During unit moves, the skirt retaining clip will be removed to avoid being removed by unauthorized persons or working loose and causing a skirt to become lost or damaged. A 3/8-inch by 2-inches machine bolt with self-locking nut will be substituted for the skirt retaining clip during shipment.

9. Maintenance. At all echelons, maintenance may be performed by personnel defined in paragraph 3 of this annex, except for repairs to special armor and other classified components. Such repairs can only be made by U.S. military or civilian personnel possessing the appropriate security clearance.

10. Damaged Special Armor. If any special armor component is damaged whereby the interior contents are exposed, it shall be protected as SECRET. The damaged portion shall be covered with a blanket, field jacket, mud, etc., secured and guarded from further exposure by uncleared personnel. Exposure to the damaged area must be restricted to those persons possessing a SECRET clearance. The exposed section will be repaired at the lowest possible level utilizing the Special Armor Skirt Repair/

Annex III to
Appendix W to
ENCLOSURE (1)

20 Aug 91

Replacement Procedure, (Annex 4). In the event that the component is damaged beyond repair, that portion will be placed in a securely sealed container (wood or metal) and shipped to Commander, Aberdeen Proving Ground, ATTN: STEAP-MT-A, Aberdeen Proving Ground, MD 21005. The container will be shipped as classified to the above address under a continuous receipt system. The M1A1 Project Officer, Code (CBGT) MCRDAC, Quantico, VA 22134, will be notified that the shipment has been made at AUTOVON 278-2137 or Commercial (703) 640-2137 or by electronic message. The M1A1 Project Officer shall notify the Special Programs Manager, U.S. Army Tank-Automotive Command, Warren, MI 48397-5000.

11. In the event that it has been determined that the interior contents of any Special Armor has been exposed to uncleared persons, those individuals will be debriefed if the armor is under a collateral SECRET program. An Inadvertent Disclosure Oath must be executed if the armor is under Special Access Program (SAP) controls.

12. A record of repairs to Special Armor or replacement of components must be completed and remain with the tank throughout its life cycle. (Annex XVI)

13. Special Armor Scrap. Any scrap materials associated with special armor shall be stored, safeguarded and disposed of as SECRET in accordance with established procedures.

14. Release of Information to Foreign Nationals/Governments. Release of information pertaining to the M1A1 tank system is subject to the provisions of OPNAVINST 5510.48J "Manual for the Disclosure of Classified Military Information to Foreign Governments and International Organizations."

15. Main Gun Ammunition. Performance data of the main gun ammunition is classified in accordance with the respective ammunition security classification guide.

Annex III to
Appendix W to
ENCLOSURE (1)

PHYSICAL SECURITY MEASURES FOR M1A1 TANK SYSTEM

1. The tank shall be afforded the minimum physical security standards as outlined in OPNAVINST 5530.14B "Department of the Navy Physical Security and Loss Prevention."
2. Classified components such as Special Armor skirts and gunshields when removed from the tank will be afforded the protection outlined in OPNAVINST 5530.13, "Physical Security for Sensitive Conventional Arms, Ammunition and Explosives (AA&E)."
3. Tanks will be guarded or under constant surveillance at all times by responsible individual(s) (i.e., crewmen and maintenance personnel during working hours and battalion, camp or base guard during nonworking hours). Foreign and third country nationals should be utilized only when the U.S. Government is bound by the Status of Forces Agreement. Perimeter/security lighting, fencing, and intrusion detection devices provide a complementary means of augmenting the security watch/patrols.
4. Adequate physical security protection must be afforded the tank in the unit area, in the field, tank parks, storage and staging areas, maintenance shops, commercial and controlled parks and port facilities, rail guards, etc.
5. Security requirements for the protection of the tank are applicable both in CONUS and overseas locations.
6. Tanks in transit (first destination shipments) are under contract to commercial carriers. Commercial carriers (rail and trucks) will comply with the instructions contained within DoD 5220.22C, "Carrier Supplement to the Industrial Security Manual for Safeguarding Classified Information." Chapter 34 of MCO P4600.14, "Defense Traffic Management Regulations", provides policies and procedures for movement of confidential, secret, and sensitive material, and includes specific instructions for surveillance service for M1A1 tanks.
7. When the tank is being moved under its own power and a breakdown occurs, the tank will not be left unattended. A responsible individual will remain with the tank at all times. In unit moves, at least one crew member will remain with the tank while the others seek assistance.
8. During transport on a transport vehicle or by a recovery vehicle and a breakdown occurs, the vehicles will not be left unattended. Either the vehicle operator or another responsible individual will remain at the scene of the breakdown while assistance is sought.

Annex IV to
Appendix W to
ENCLOSURE (1)

MCO 8420.13

20 Aug 91

9. The security requirements contained within the referenced regulations should not be waived. To do so seriously degrades the security program associated with a classified weapons system.

10. Sound judgment and a common sense approach should be taken in the measures employed to protect the tank and its components from any person or persons that might compromise its decisive edge in a combat environment.

Annex IV to
Appendix W to
ENCLOSURE (1)

IVW-2

SPECIAL ARMOR SKIRT REPAIR/REPLACEMENT PROCEDURE

1. SKIRT REPLACEMENT/REPAIR CRITERIA

a. Prior to initiating repairs, a determination should be made by a qualified maintenance officer/technician as to whether the affected skirt(s) should be repaired or replaced. This is necessary since the extent of the damage could significantly reduce the protection provided the tank crew, even if repaired. In the event that a skirt is damaged to the extent that it requires replacement and there is no replacement skirt available, the damaged skirt should be repaired, utilizing the described applicable procedures, and then replaced at such time as a replacement skirt becomes available.

b. In determining whether a skirt should be repaired or replaced the following criteria should be used:

(1) Broken Welds

If welds break, allowing the joined surface to separate to the extent that they cannot be squeezed to their original configuration with clamps or whatever tools and equipment are available, the affected skirt should be replaced.

(2) Damaged Sides

Measure the approximate width and length (in inches) of the damaged area as shown in figure W-1. Multiply both measurements length by width to get a rough approximation of the damaged area. If the area exceeds 110 iny (cumulative in two or more locations) the skirt will be replaced. If damage has occurred to both sides, make the measurement on both sides and add the two areas (length by width of one side + length by width of the other side). If the combined areas exceed 110 iny in two locations, the skirt will be replaced. If the areas are less than 110 iny, the skirt will be repaired.

NOTE: Personnel making the above type of repair to the damaged skirt or special armor where the exterior surface has been breached exposing the interior, such personnel must be cleared to the level of SECRET.

(3) Bent skirts

If a skirt is bent to the extent that it cannot be closed or sticks out more than 2 inches, it should be replaced.

Annex V to
Appendix W to
ENCLOSURE (1)

MCO 8420.13
20 AUG 1991

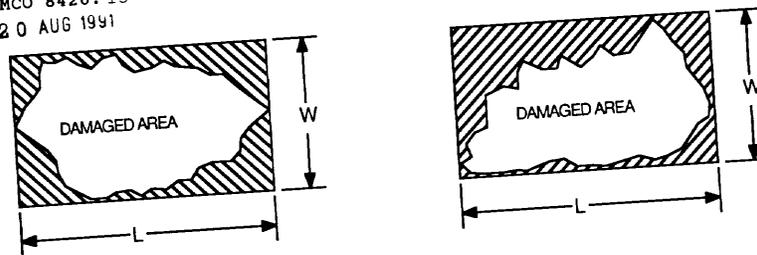

Figure W-1--Damaged Sides.

2. SKIRT REPAIR PROCEDURES

a. General

All repairs requiring welding should utilize electric arc welding equipment. Gas welding may be substituted on an emergency basis, however, this is discouraged. Although any suitable electrode may be used, stainless steel 308 rod is recommended for all repairs.

b. Cracked or Broken Welds

(1) If skirt welds are cracked or broken with no separation, grind out failed weld and reweld.

(2) If skirt welds are broken with separation, squeeze the skirt to its original configuration with clamps or whatever tools and equipment are available, grind and reweld.

c. Broken Mounting Eye or Hinge

Remove broken eye or hinge by air-arcing or grinding and weld on replacement eye or hinge.

d. Gouges or Holes in Outer Side of Skirts

(1) Grind smooth all protrusions extending beyond surface of skirt.

(2) For gouges 1/2 inch or less in depth, fill with weld material and grind smooth with surface. To minimize heat input, allow area to cool to hand touch between grinding and welding operations.

Annex V to
Appendix W to
ENCLOSURE (1)

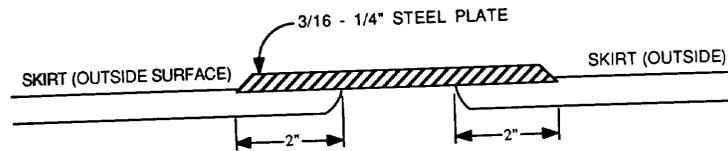

Figure W-2--Damaged Skirt (Outside).

(3) For holes and gouges deeper than 1/2 inch, cover area with a 3/16 - 1/4 inch steel plate (Rolled Homogenous Armor (RHA), if available) and weld in place using fillet weld equivalent to plate thickness. The plate should overlap the damaged area by at least 2 inches on all sides. (figure W-2).

e. Gouges or Holes in Inner Side of Skirt

(1) Do not repair minor gouges (i.e., those less than 1/8-inch deep with no cracking).

(2) For other damages, remove a rectangular section around the defective area (as shown in figure W-1) by machining or grinding (section removed should not exceed 3/16-inch deep). Under no circumstances are air-arcing or flame cutting permitted.

(3) Prepare a rectangular patch from 3/16-inch steel (Rolled Homogenous Armor (RHA), if available) of the same size as the cavity. Patch should be sized as close as possible to the dimensions of the cavity and must be 3/16-inch thick.

(4) Machine or grind a 45o chamfer around the patch.

(5) Insert patch into cavity (figure W-3).

(6) Tack weld into place.

(7) Using a 1/8-inch electrode, weld all around the patch. To minimize heat input, allow to cool to hand touch between passes.

(8) Grind weld flush.

Annex V to
Appendix W to
ENCLOSURE (1)

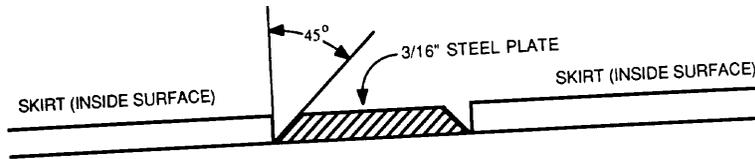

Figure W-3--Damaged Skirt (Inside).

NOTE: Due to the excessive amount of smoke that may be generated in the welding process, wearing of the NBC mask is recommended.

3. REPAIR CRITERIA FOR NON SKIRT ARMOR.

a. The structural integrity of the nonskirt armors will preclude most minor accidents from causing damage. However, the turret armors on all M1A1's with a "U" at the end of the turret serial number contain Depleted Uranium (DU). Procedures outlined in TM 3-261 should be used if radioactive material has escaped from the turret cavity.

b. If the outer skin has been punctured, ripped or cracked a patch should be fabricated out of available materials and welded over the opening. The purpose of the patch is secure the classified armor arrays and not improve the ballistic capabilities of the damaged armor. The damaged should be evaluated at the appropriate maintenance level and repairs done as required.

NOTE: Personnel making the above type of repair to armor where the exterior surface has been breached exposing the interior, such personnel should be cleared to the level of SECRET. If it is necessary to use uncleared personnel to expedite repairs then the procedures identified in Annex III paragraph 11 should be used.

c. Use caution when welding in the area of damaged DU turret armor. DU is extremely pyrophoric (burns very well). The patch should exceed the size of the damaged area by 4 to 5-inches when possible.

Annex V to
Appendix W to
ENCLOSURE (1)

4. Any scrap materials associated with classified armor shall be stored, safeguarded and disposed of as SECRET or SECRET-Special Access Required in accordance with established procedures. The only organization authorized to dispose of classified armor scrap is identified in paragraph 10 Annex III of this guide. Armor scrap will not be disposed of outside of CONUS.

Annex V to
Appendix W to
ENCLOSURE (1)

VW-5

SECURITY PLAN FOR RAIL AND OCEANIC SHIPMENT OF M1A1 TANKS

1. References:

- a. DoD 5220.22M, "Industrial Security Manual for Safeguarding Classified Information."
- b. MCO P4600.14, "Defense Traffic Management Regulations."
- c. TM 55-2350-255-10-15, "Transportability Guide for M1 Tank."

2. Purpose. The purpose of this plan is to prescribe basic security preparations to provide for adequate safeguards of M1A1 Tanks in transit by rail. The plan eliminates the requirements of utilizing cleared carriers or cleared government/contractor personnel as escorts in accordance with reference (a). The plan does not address shipments of Special Armor skirts, gunshields or other components separate from the tank or Special Armor structures for test or production purposes. The text of this Annex is amplified by Annexes VII through XIV.

3. Applicability. This plan is applicable to first destination shipments from the Detroit Arsenal or Lima Army Tank Plants. The plan may be modified to provide for retrograde shipments from overseas locations to CONUS, in addition to unit moves, such as those to and from training areas.

4. Safeguards. Considering the size, weight, and structural integrity of the tank, use of reasonable and cost-effective security measures will be employed to safeguard the tank from compromise while in transit will be provided by carriers. Tank Surveillance Service (TSS) will be provided for all rail shipments of the M1A1.

5. General

- a. All information pertaining to shipments of the M1A1 tank, to include plans, dates, routes, final destination, etc., is "sensitive unclassified" information and will be protected. Under no circumstances will such information be released to the public. All organizations involved in shipments will disseminate such information only in a "need-to-know" basis.

- b. All initial shipments are made by rail from either of the two production facilities to a limited number of ports. Rail carriers are limited in availability and cannot always provide for alternate routes. Transportation officers and the Military Traffic Management Command (MTMC) should take a coordinated approach to alternate shipment dates in order to avoid an established pattern whenever feasible.

Annex VI to
Appendix W to
ENCLOSURE (1)

20 Aug 91

c. Reference (a) provides policies and procedures for movement of confidential, secret, and sensitive material, and includes specific instructions for surveillance service for M1A1 tanks. Rail carriers will be provided specific instructions by MTMC concerning shipments and shipment information to include the following:

(1) Shipments will not be left unattended on remote, unilluminated, unobservable rail sidings.

(2) Shipment information will be disseminated only to those personnel requiring it in an official capacity necessary to support the program.

(3) Tank Surveillance Service (TSS), which provides for inspections within one half-hour after each stop, and reinspection at least once more each half-hour thereafter if the railcar(s) containing the tank remain at a halt, is required. Carriers will be provided the methods for conducting such inspections by MTMC.

(4) Notification procedures and actions required in the event of a shipment delay, accident or incident will be provided by MTMC.

(5) Unit moves, (such as shipments to and from training areas, etc.) shall be accompanied by unit guards or escorts or TSS may be requested by the responsible Transportation Officer.

6. Vehicle Preparation for Shipment

a. All hatches will be secured from the interior except for the loader's hatch. The loader's hatch will be secured from the outside, utilizing a Trans-Lok serially numbered bolt seal bearing the logo DATP or LATP for all first destination shipments (See Annex XI). In addition, a strip of bending steel will be placed over the loader's hatch and secured to the side rails. A strip of red fluorescent tape will be placed over the banding strap, extending the width of the side rails to provide for night visibility. The hatch will be sealed with waterproof tape to prevent moisture from entering the tank.

b. For unit movements, the hatch will be secured with a medium security padlock or a hardened bolt and nut. The bolt will be peened or spot welded to prevent ease of removal.

c. All skirts will be mounted on the tank. The standard skirt closure pin will be used to secure the skirts with a Trans-Lok bolt replacing the securing clips. (Do not discard the securing clips, store them inside the tank for use when the Trans-Lok is removed).

Annex VI to
Appendix W to
ENCLOSURE (1)

20 Aug 91

d. Upon completion of loading the tank onto the railcar, the tank will be immobilized by disconnecting the batteries to prevent starting of the engine.

e. The tank will be secured to the railcar in accordance with reference (c).

7. Pre-movement Inspection

a. In addition to the normal rail pre-movement inspection, each tank will receive a security inspection to ensure that all of the required measures to safeguard the shipment have been taken.

b. A "Pre-shipment Inspection Checklist" will be completed for each tank in the shipment. The original copy of the completed checklist will be mailed to the receiving location, with a duplication copy in suspense. The original copy will be returned by the receiving location to the originator, with appropriate remarks. (See Annex VII).

c. For unit moves, the checklist at Annex VIII will be utilized. The same procedure contained in 7a., above will be used.

8. Shipment Routing

a. Transportation Officers will compile a listing of all possible shipping routes for tank shipments.

b. Transportation Officers will advise the responsible Security Officer of any report pertaining to shipment delays, accidents or incidents associated with tank shipments.

c. Actions to be taken in the event of an accident/incident are covered in Annex IX.

9. Inspection at Destination

a. Responsible individual(s) receiving tank shipments will inspect each tank upon receipt to determine if any tampering occurred during shipment. Each tank requires a close examination of all exterior surfaces for damage or penetration. If there is evidence of the tank having been entered during shipment, a close examination of the interior must also be made. Any evidence discovered must be recorded on the Pre-shipment Inspection Checklist.

b. Any signs or evidence of tampering that would indicate a compromise of classified information will be reported immediately by the receiving activity to the originating Security Officer by the most expeditious means available. If there appears to have been a penetration of the Special Armor components, measures must

Annex VI to
Appendix W to
ENCLOSURE (1)

MCO 8420.13
20 Aug 91

be taken to protect the component from further exposure to unauthorized individuals.

c. In the event that a shipment arrives after normal duty hours, the receiving activity will take necessary action to protect the tank(s) from damage or unauthorized entry.

10. Security Aboard Ship. The ship's captain is responsible for M1A1 security during the entire time they are aboard his vessel.

Annex VIII to
Appendix W to
ENCLOSURE (1)

ACCIDENT/INCIDENT PROCEDURES AND SHIPMENT DELAYS

Immediately upon discovery of an accident/incident involving a tank shipment, carriers will take immediate action to secure the shipment with their resources or seek assistance from a local or state law enforcement agency. The shipper will be advised of the accident/incident, the location, type and the extent of damages. Further actions are required as follows:

1. The carrier will cause the shipment to be secured by whatever means are available. If there is damage to the extent that a compromise to classified information is possible or has occurred, the carrier must immediately contact the shipping transportation officer immediately, who in-turn will notify the security officer.
2. If the damage has caused a breach to the exterior layer of the Special Armor, the affected areas will be covered immediately to prevent further observation by uncleared persons. Materials such as blankets, tarps or mud should be used to protect the exposed area from observation.
3. In all such situations as outlined above, the transportation officer and security officer will travel to the scene and take the appropriate actions.
4. If the incident/accident results in a security violation, a Serious Incident Report (SIR) will be submitted through appropriate command channels in accordance with MCO 5740.2E, "Event/Incident Reports." NIS, the Commanding General, MCRDAC (CBGT), Quantico, VA 22134 and the Commander, U.S. Army Tank-Automotive Command (AMLPED-HFM-X), Warren, MI 48397-5000 will be notified.
5. The receiving location and MTMC will be notified of the accident/incident.
6. Shipment delays, such as a train parked on an isolated siding, may impact on tank security; therefore, carriers are required to report all such delays to the shipper representative to ensure that all required security measures are employed.
7. In the event of an accident, derailment or significant delay or other incident that impacts on security, the transportation officer or security will notify the Commanding General, MCRDAC (CBGT), Quantico, VA 22134.
8. The appropriate officials at the receiving location will be notified of the incident/accident and the delay in shipment.

Annex IX to
Appendix W to
ENCLOSURE (1)

SECURITY OF M1A1 MAIN BATTLE TANK ABOARD MPS SHIPPING

1. The tank shall be afforded the minimum physical security standards outlined by this guide.

2. Classified components, such as Special Armor skirts and gunshields when removed from the tank, will be afforded the protection outlined by this guide.

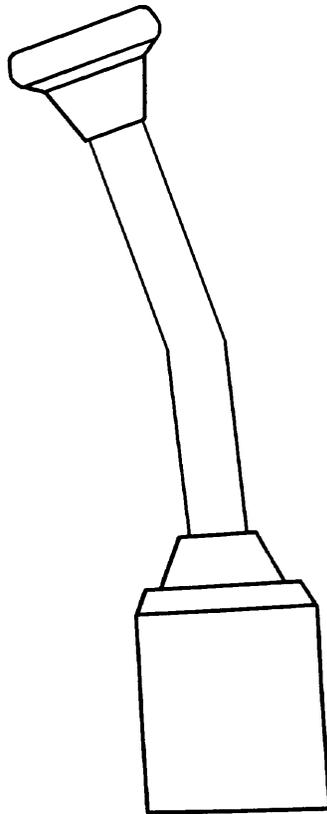

3. Even though the interior and exterior of the tank are UNCLASSIFIED, only authorized persons with an official "need to know" will be permitted access to the interior. The definition of "AUTHORIZED PERSONNEL" is U.S. military or DoD civilian personnel and foreign nationals that have a need for physical access to the tank; e.g., crew, maintenance and security personnel, training technicians, etc.

STANDARD SECURITY AND INADVERTENT DISCLOSURE PROCEDURES

1. (U) Standard Security Procedures: In addition to the special security procedures outlined in this document, standard security procedures for the handling of classified information as outlined in appropriate Department of the Navy or Industrial Security Regulations apply.
2. (U) The compromise or possible compromise of classified information shall be handled by DoD activities in accordance with DoD 5200.1R, "Department of Defense Information Security Program Regulation." Contractors shall handle in accordance with paragraph 7, DoD 5220.22M.
3. (U) Despite vigilance and attention to security requirements, minor security violations may occur. Lack of preparation regarding proper action to be taken in the event of a compromise can create even more serious problems. The first person who learns of a potential compromise will do all she/he can do to prevent the situation from worsening and will immediately notify their Security Manager. The Security Manager will make an initial assessment of the seriousness of the compromise based upon the facts immediately available. This information shall be reported to the Commanding General, MCRDAC, by the most expeditious secure means available. Timeless of reporting is more important than a complete report. The Security Manager must quickly arrive at the conclusion that the violation is (a) critical, (b) serious, or (c) procedural. These terms are defined as:
 - a. (U) Critical - Program information has been compromised and there appears to be no certain way to limit the dissemination of that data (e.g., a research and development periodical is about to be published or has published an article which correctly defines the program data).
 - b. (U) Serious - Program information has been compromised and containment of dissemination of this data, although difficult, appears to be possible (e.g., an electrical message containing the program data has been sent through clear channels, and an unknown number of people have had potential access to the message).
 - c. (U) Procedural - Program information has been incorrectly protected, but it appears that no compromise of the data has taken place (e.g., a program document has been incorrectly handled when being sent through U.S. postal channels, but has arrived at the correct address, and is in the custody of a properly cleared person).
4. (U) Upon receipt of a report concerning a serious or critical compromise, the local commander will immediately begin

Annex XII to
Appendix W to
ENCLOSURE (1)

20 Aug 91

an investigation. The report of investigation will be submitted to the Commanding General, MCRDAC (CBGT), Quantico, VA 22134 within 15 days after the conclusion of the investigation and will report the effect of the compromise and recommend remedial actions. A copy of the report of investigation will be forwarded to the Commander, U.S. Army Tank-Automotive Command (AMLPED-HFM-X), Warren, MI 48397-5000.

5. (U) Inadvertent Disclosure:

When a person/persons, regardless of rank, title or position, who is inadvertently exposed to classified material and such exposure does not constitute a critical or serious security violation and the exposed material can be contained without fear of dissemination, the following procedure will be followed. The person/persons will be debriefed and required to complete the Inadvertent Disclosure Oath Form found in this tab on page XVW-1.

6. (U) Should the Inadvertent Disclosure be found to be:
a. critical, b. serious, c. procedural, as found in Section 3 and 4 above, the instructions found in those sections will be followed and the Inadvertent Disclosure Oath Form completed with a debriefing. A copy of a completed debriefing and the Inadvertent Disclosure Oath Form found in this annex will be attached to the investigation report submitted to Commanding General, MCRDAC (CBGT), Quantico, VA 22134.

NOTE: The Inadvertent Disclosure Oath Form may be reproduced from this guide.

Annex XII to
Appendix W to
ENCLOSURE (1)

INADVERTENT DISCLOSURE OATH

I certify that I will never divulge the classified information inadvertently exposed to me, and will not reveal to any person my knowledge of the existence of such information. I understand transmission or revelation of this information in any manner to an unauthorized person is punishable under U.S. Code Title 18, Sections 793 and 794 and/or appropriate articles of the Uniform Code of Military Justice. I further certify I will never attempt to gain unauthorized access to such information. My signature below does not constitute an indoctrination or clearance, but acknowledges my understanding of the above.

NOTICE: The Privacy Act, 5 U.S.C. 552A, requires that federal agencies inform individuals, at the time information is solicited from them, whether the disclosure is mandatory or voluntary, by what authority such information is solicited, and what uses will be made of the information. You are hereby advised that authority for soliciting your Social Security Account Number (SSAN) is executive Order 9397. Your SSAN will be used to identify you precisely in determining when your access to the information indicated occurred. Although disclosure of your SSAN is not mandatory, your failure to do so may impede such determination.

Annex XIII to
Appendix W to
ENCLOSURE (1)

EMERGENCY PROCEDURES FOR PEACETIME ACCIDENTS INVOLVING
DEPLETED URANIUM (DU)

1. Purpose. To provide guidance for reporting accidents and incidents involving DU components and to provide instructions for minimizing radiological hazards to personnel and the environment during subsequent decontamination operations.

2. General

a. Information. The M1A1 uses DU in the construction of the Heavy Armor Package to enhance battlefield survivability and ammunition which uses a DU kinetic energy penetrator. Since the DU in the Heavy Armor Package is fully encased in welded steel, the M1A1 poses no significant radiological hazard under normal conditions. Likewise the ammunition packaging is constructed to withstand normal handling and transportation as well as the rigors of field operations during training and combat. However, in the case of accidents exposing the DU, special procedures must be followed to ensure appropriate agencies are notified and to minimize the spread of radioactive contamination.

b. Radioactive Material. The DU is categorized as source material and controlled by federal regulations under the Nuclear Regulatory Commission (NRC). An NRC license has been issued to the TACOM which authorizes DoD possession of the DU installed in the M1A1 tank. The TACOM radiation protection officer is the primary point of contact with the NRC regarding compliance with this NRC license. Headquarters Marine Corps (LPO), which manages the Marine Corps Radiological Affairs Support Program (RASP), is the primary point of contact regarding Marine Corps use of radioactive material.

c. Radiological Safety Officer (RSO). Installations and bases usually have designated and trained radiation safety officers for control of various radiation sources and radioactive items, including oversight of the use of radioactive devices possessed by units on the base. Appointment of individual RSO's at the user level solely for DU armor is not required. Responsibility for observing precautions and initial emergency actions for radioactive components associated with the M1A1 can be entrusted to an accountable individual such as the unit's safety officer or NBC officer. The guidance in this appendix provides specific instructions and requirements for radiological surveys, decontamination, shipment, and disposal operations following damage to DU armor or scattering of DU material.

d. Radiological Considerations. Depleted Uranium is uranium from which the specific uranium isotopes U-234 and U-235 have been extracted. What remains contains about 99.7 percent of U-238 and is referred to as DU. The radioactive half-life of U-238 is approximately 700 million years. This long half-life means that the radioactive decay rate of DU is very low. As an

Appendix X to
ENCLOSURE (1)

20 Aug 91

example, it takes about 3 metric tons of DU to produce radioactivity equivalent to that produced by 1 gram of radium. Alpha, beta, and gamma radiations are emitted by U-238 and its daughter products>

(1) Only gamma radiation is detectable from the DU encased in welded steel plates. The DU armor was designed so that the gamma radiation reading at any surface point would not exceed 0.45 millirem per hour. External radiation exposure to personnel is not significant because of the low surface contact dose rate and the limited amount of time that one could be in direct contact with the armor plates covering the DU.

(2) Internal body contamination is the concern if uranium is inhaled or ingested. This can only occur if an accident exposes the DU and produces very small DU particles. In the presence of very high temperatures, uranium can be oxidized to form uranium oxides which may then be dispersed. Again, because of its low radioactivity, the toxicity of uranium as a heavy metal poison actually represents more of an acute biological hazard than does the radioactivity.

(3) The initial objectives of any accident response involving radioactive material is to regain control over the event and prevent further spread of any contamination produced. Some of the radiological measurements described in this appendix will be beyond the capabilities of the command. Technical assistance in radiological monitoring may be required from radiological personnel at nearby Army, Navy, or Air Force bases, or from Navy Radiation Health Officers assigned to some Naval Bases and Hospitals. Marine Corps capabilities for analyzing wipe tests for radioactive contamination are available from MCLB, Albany and MCLB, Barstow and the 3d FSSG Radiac Calibration Facility. Radiation safety personnel located at MCLB, Albany and MCLB, Barstow are also a valuable Marine Corps resource. Major contamination incidents may require fielding a team of experts to properly conduct and document the recovery operation.

(4) The on-scene commander must recognize the implications of failure to control the spread of radioactive contamination, especially on non-Marine Corps property. Proper actions taken, which limit the contamination to small areas, greatly reduce the subsequent clean-up efforts. The radiological measurements conducted to authorize release of the tank and the surrounding area must be carefully performed and documented to withstand challenges to the credibility of the measurements.

Appendix X to
ENCLOSURE (1)

3. Notification Procedures

a. Accidents and incidents will be reported immediately through the chain of command ensuring that the following agencies are notified: CMC (LPO-1), Washington, DC 20380 (DIN 226-1089, commercial (202) 696-1084); CG, MCRDAC (CBGT) Quantico, VA 22136 (DIN 278-2137, commercial (703) 640-2137); and license RPO, TACOM Safety, US Army Tank-Automotive Command, ATTN: AMSTA-CZ, Warren, MI 48397-5000 (DIN 786-8529/6121, commercial (313) 574-8529/6121).

b. Examples of the types of accidents and incidents which will be reported include:

(1) Theft or loss of control of DU armored M1A1 tanks or DU ammunition.

(2) Fires, explosions, or accidents where the DU armor in the M1A1 or DU ammunition could be damaged.

(3) Accidents or incidents that damage or expose the DU Armor or DU ammunition to the environment or release DU to the environment.

(4) Accidents or incidents that result in an actual or potential radiation exposure from material associated with the M1A1 tank.

b. Initial notification for the above types of accidents and incidents will be made telephonically or by immediate message with a written follow-up report within 15 days.

c. In addition to the organizations listed above, the following personnel shall be notified immediately of any accidents or incidents involving DU:

(1) Local commander.

(2) Local base RSO or base safety officer.

(3) Local public affairs officer (PAO).

(4) Personnel to assist in decontamination and clean up (chemical company, maintenance personnel, EOD).

d. MCO 5740.2, "Event/Incident Reports," should be reviewed to determine if the accident or incident meets the criteria for the submission of an OP REP-3, Serious Incident Report (SIR).

Appendix X to
ENCLOSURE (1)

e. Accident/incident reports shall include the following information:

- (1) Name of person reporting.
- (2) Phone number of person reporting.
- (3) Person in charge of scene.
- (4) Location of accident site.
- (5) Date and time of accident.
- (6) Organizations involved in accident.
- (7) Equipment involved.
- (8) Property damaged/contaminated.
- (9) Extent of injuries/overexposure.
- (10) Narrative description of accident.
- (11) Cause of accident (if known).
- (12) Type of collision (rollover, jackknife, head-on, vehicle speed, etc).
- (13) Fire involved? (yes or no)
- (14) Did weather conditions contribute to accident?
- (15) Did defective equipment contribute to accident?
What component and how is it defective?
- (16) Individuals and agencies known to have been notified and the response being made.

f. Other accidents/incidents not involving the DU armor on the M1A1 tanks will be handled according to current accident reporting policies, regulations, and procedures.

4. Accident Management Procedures. The first priority shall be to provide immediate assistance to injured personnel. This takes priority over contamination checks and decontamination procedures.

a. Accidents or Incidents With No Fire. Accidents or incidents in which there is no fire or explosion shall involve:

- (1) Roping off the area to prevent unnecessary personnel from entering the area. This is to prevent scattering of DU and

to prevent personnel from being unnecessarily exposed to radiological contamination.

(2) Performing a radiological survey of the area using radiation detection instruments. This is to determine if any DU is scattered and the extent of contamination.

b. Accidents or Incidents Involving Fire. Accidents or incidents involving fire or explosions shall be handled in the following manner:

(1) DU, when exposed to fire, will be either in solid form, fragmented form, or in a DU oxide dust form. The toxicological/radiological characteristics of DU are a secondary hazard to the fire and explosion hazard. Should crew members have to evacuate the tank, they should:

(a) Attempt to shut down the engine in accordance with tank operator's manual.

(b) Attempt to activate the fire suppression system.

(c) Move a safe distance away, upwind, from any smoke coming out of the tank. Establish a safety perimeter of at least 610 meters (2000 feet) from the tank.

(d) Keep unnecessary persons away from the accident scene with the assistance of the local authorities (police, fire department, or military police).

1 Notify nearest fire department, whether military or municipal, if not already on the scene.

2 Notify police (military or municipal) if not already on the scene.

(2) Fire departments responding to tank fires should be directed by a tank fire control officer or a crew member familiar with fire fighting procedures. The senior on-scene fire department officer will decide whether to fight the fire or withdraw based on an assessment of the accident and surrounding circumstances.

(3) All personnel not actually engaged in fire fighting, life saving, or traffic control will be cleared from the accident area. Expose the minimum necessary number of emergency personnel to the fire.

(4) There is a danger of detonation of the explosives if fire is present; in this case, all personnel will remain upwind, and if possible, uphill from the fire.

Appendix X to
ENCLOSURE (1)

20 Aug 91

(5) In saving lives, use any available method to prevent smoke from entering the eyes, nose, and throat; self-contained breathing apparatus or respirator (for use in lifesaving operations) should be used.

(6) All personnel evacuated from the area should report to a control point established upwind from the accident site. Detain all persons and equipment exposed to smoke until released by radiological authority. If any person cannot be detained, obtain names and where he or she can be contacted later.

(7) The standard firemen's bunking clothing, boots, gloves, and helmet provide adequate shielding against contamination which may be present when approaching a burning tank. Self-contained breathing apparatus and tight-fitting goggles should be worn if at all possible. The self-contained breathing apparatus worn by fire fighters will protect against the inhalation of any DU oxide dust in the smoke plume of the fire. The fact that some or all of these items are not available should not hold up the rescue of personnel.

(8) When ammunition is directly involved in fire, or rounds have been expelled from the tank, no attempt to fight the fire will be made. Fire trucks will be positioned not closer than 370 meters (1,200 feet) to the burning tank. Emergency personnel shall notify the local EOD unit of the above situation. EOD will work with the fire department and RSO to resolve the potential explosion hazard.

(9) When the decision is made by the fire department for fire fighters to approach the tank, it should be upwind from any smoke coming from the tank and at a maximum angle to the line of the gun barrel. The approach should afford maximum effective application of extinguishing agents on the critical area and permit rapid withdrawal of personnel and equipment. Fires should be fought as far upwind as possible, keeping out of smoke, fumes, and dust.

(10) When ammunition and DU Armor are not involved in the fire and the hatches are open, the fire should be fought with water, stream or spray, using as much protective cover as possible.

(11) If the engine is on fire, only dry chemical or foam should be used to extinguish the fire.

(12) Ideally, as little water as possible should be used to put out fires inside tanks and on exposed DU armor, since the water may become contaminated with DU. Attempts should be made to contain and collect the potentially DU-contaminated water to minimize the spread of contamination. The area around the tank should be diked to collect water used to put the tank fires out. If water collection and retention procedures create additional risk, then the water should just be emptied from the tank onto the ground.

Appendix X to
ENCLOSURE (1)

(13) Fire fighters, EOD, and any other personnel or equipment, including vehicles, exiting the fire area are to be monitored for the presence of any DU contamination before moving over the contamination control line. The monitoring instrument to be used is an AN/PDR-27S with the beta shield open, an AN/VDR-2, or an equivalent instrument. These meters, when used for personnel monitoring, should be equipped with earphones to permit aural indications to supplement the slower needle response. The sensory portion of the meter probe will be placed as close to the portion of the item or body being checked as possible, without bringing the probe into direct physical contact.

d. y. Personnel injured in the accident will be evacuated through medical channels. Injured personnel evacuated from the accident scene should be tagged to indicate possible exposure to DU contamination. Medical treatment for serious injuries takes priority over contamination surveys and decontamination operations.

e. Radiological Survey and Decontamination Procedures

(1) After the tank is declared safe from an explosive standpoint, radiation protection personnel will conduct a radiological survey of the ground, anything lying on the ground, and the exterior of the tank. Personnel assisting in the radiation survey and decontamination operations should wear fullface respirators with high-efficiency dust filters. Tape is to be used to seal the clothing where there are any openings to the body.

(2) Radiation protection personnel will set up a radiation contamination control line upon their arrival. The radiation contamination control line should be adjusted depending on the extent of ground contamination. If no ground contamination is detected during the radiation survey of the area, rope off a 10-foot radius around the area to control access to it. However, should ground contamination be detected, the areas should be marked for later decontamination efforts.

(3) The number of EOD and emergency personnel who are to cross the radiation contamination control line established by the RSO should be kept to an absolute minimum. They are to be dressed in protective coveralls, gloves, and rubberized boots; they are to also wear the M17A2 protective mask with M13A2 filter element and the accompanying head covers. The overall pant legs are to be worn over the rubber boots and sealed with tape at the ankles. Likewise, the sleeves are to be slipped over the gloves and taped. The edges of the hood are to be draped over and taped to the coveralls. Also, any remaining openings are to be sealed with tape. The RSO will supervise during dress-up procedure.

(4) The radiological survey of the ground should be conducted with an appropriate low-energy photon detection

instrument. The probe must be held as close to the ground surface as possible without coming in direct contact.

(5) Radiological surveys of the outside of the tank for DU contamination will be done with an AN/PDR-27S or an equivalent instrument if the surface of the tank is dry. The probe must be held as close to the surface as possible without coming in contact. However, if the surface being surveyed is wet or covered with grease or dirt, there exists a condition of alpha self-absorption and an AN/VDR-2 or an equivalent instrument is to be used. Swipe/wipe the surface of any location where contamination is detected. The swipe samples should be taken with appropriate swipe paper, such as Whitman filter paper. The same instrument being used to survey the tank should be used to analyze the swipe paper. If, for whatever reason, the appropriate swipe paper is not available, then take samples with a paper towel, cloth, etc. Under these circumstances, analyze the swipes only with an AN/PDR-27S with the beta shield open, an AN/VDR-2, or an equivalent instrument. If contamination levels are detected, the surface area that is representative of that sample is to be cleaned until the removable surface contamination levels are at least reduced to 2200 dpm/100cm² beta-gamma and alpha for restricted areas and 220 dpm/100cm² beta-gamma and alpha for unrestricted areas.

(6) If the exterior of the tank is contaminated, the following method shall be used to decontaminate tank surfaces:

(a) Place masking, adhesive, friction, or duct tape over the contaminated area, remove and discard as radioactive waste.

(b) Use vacuum-cleaning techniques with a conventional wet or dry vacuum cleaner modified to include a High-Efficiency Particulate Air (HEPA) filter on the exhaust. Dispose of bag or collection container as radioactive waste.

(c) Wipe or wet-mop, using a decontaminating agent or detergent and hot water. Organic solvents, acids and acid mixtures, or caustics may also be useful.

(d) Upon decontamination of the exterior of the tank (to include cracks, holes, and air passages), seal openings to preclude the escape of any interior contamination into the environment. The tank openings must be closed with substances such as caulking compound, foam sealant, etc., or otherwise sealed with tape or covered with a tarp or heavy plastic. The intent is to create a strong, air-tight package to preclude the radioactive contents from exiting during transport in compliance with shipping regulations.

(7) If the above methods do not completely decontaminate exterior surfaces, then contamination should be considered fixed and the tank should be transported to an appropriate military

20 Aug 91

facility before harsher methods are used. The location of the facility and transportation requirements will be determined by the CG, MCRDAC (CBGT).

(8) Before transporting the tank to the designated facility, any contaminated ground surface over which the tank must pass to exit the radiation contamination control line must first be decontaminated. This may entail the removal of the top layer of soil and disposal of the soil as radioactive waste or the cleaning of a hard-surfaced road.

(9) All dirt must be removed from the tank treads and other surfaces on the tank before transport to comply with Department of Agriculture regulations. This dirt, if contaminated, must be treated as radioactive waste.

(10) Following the tank's removal, the area that had been under the tank must be surveyed and, if necessary, decontaminated. Concurrently, all other surfaces that were contaminated are to be decontaminated to background levels. Radioactive waste must be transported to a nearby military installation for holding until it can be disposed of as radioactive waste in accordance with MCO 4570.24, "Hazardous Material/Hazardous Waste Disposal."

(11) Other equipment or personnel that have been contaminated with DU should be decontaminated in accordance with standard radiological decontamination procedures.

(12) Contaminated clothing should be removed, if feasible, at the accident site.

(13) Equipment and material release should be adequately documented by radiation protection personnel and proper security procedures put in force to prevent pilferage and to assure items are decontaminated before release.

(14) The local military facility will assure that waste receptacles are available and located at the radiation contamination control line for disposal of contaminated clothing and equipment. Metal containers with lids should be available with 4-mil plastic bag inner linings for solid waste. Liquids must be segregated from solids to process the waste through the normal disposal channels. Liquids should be collected in plastic, earthenware, or thick-walled, glass-bottle inner containers. Leak-proof metal cans may also be used, provided the container is chemically inert to the liquid. Radioactive waste should be held at a nearby military installation until disposition can be made in accordance with MCO 4570.24.

(15) Once the exterior surface of the tank is decontaminated down to removable 2200 dpm/100cm² beta-gamma and alpha for restricted areas, 220 dpm/100cm² alpha, beta and gamma

Appendix X to
ENCLOSURE (1)

20 Aug 91

for unrestricted areas, and all openings in the tank closed off, the tank will be transported in accordance with 49 CFR 173 to Anniston Army Depot. The tank will be shipped as retrograde equipment. The shipments should be made to the nearest available base or port, then by truck or rail to Anniston. The shipment should be made within the normal defense transportation system. The tanks will be evaluated at Anniston for extent of damage and possible reuse of parts. Decontamination and/or disposal of parts will be accomplished for parts not acceptable for reuse.

5. Transportation

a. The tank turret/hull and complete tank with the DU armor will be shipped under 49 CFR 173.424 (excepted articles containing natural uranium or thorium). Tanks decontaminated down to removable 2200 dpm/100cm² beta-gamma/alpha for restricted areas and 220 dpm/100 cm² alpha/beta gamma for unrestricted areas will be shipped under 49 CFR 173.424. Requirements for transport under this section are:

(1) Radiation level at any point on the external surface of the turret or complete tank does not exceed 0.5 mrem/hr.

(2) The outside of the inner packaging (DU package before insert in tank) bears the marking "RADIOACTIVE".

(3) Having a notice enclosed in or on the turret or tank, included with the packing list, or otherwise forwarded with the turret or tank. The notice must include the name of the consignor or consignee and the statement "This package conforms to the conditions and limitations specified in 49 CFR 173.424 for excepted radioactive material, articles manufactured from natural or depleted uranium or natural thorium, UN 2909."

(4) Placards are not required.

b. If the tank is destroyed to the point that the inner packaging marking in the armor is destroyed, then the outside of the tank must be marked with the word "RADIOACTIVE" in letters at least 1/2 inch high and in a color which contrasts with the tank. This marking may be covered with a tarp if necessary, since 49 CFR allows the marking to be on the outside of the inner package. It is recommended that the marking be painted in white letters on the turret and covered with a tarp.
